REMEDIAL INVESTIGATION DATA REPORT

WESTERN PROCESSING KENT, WASHINGTON

EPA WA 37-0L16.1

December 17, 1984

15th floor/15 EXTS

U.S. ENVIRONMENTAL PROTECTION AGENCY
REGION X
1200 SIXTH AVENUE
SEATTLE, WASHINGTON 98101

REPLY TO
ATTN OF: M/S 525

December 17, 1984

Dear Sir or Madam:

The U. S. Environmental Protection Agency (EPA) has just released its Remedial Investigation Report on the Western Processing Company site in Kent, Washington. This report completes the field data collection phase of work leading to the selection of the final cleanup remedy for the site.

The report discusses the methods and presents the technical results of the onsite and offsite field and laboratory work done by EPA, Washington Department of Ecology, CH2M Hill, other EPA contractors, and other government agencies, with emphasis on the work done since May 1984. One chapter contains an annotated listing of all previous data reports. The final chapter summarizies the surrounding land use, utilities and zoning.

The Remedial Investigation report is designed to be used with the Feasibility Study report for determining the appropriate remedial action. The Feasibility Study report will be available in January 1985. Comments on the Remedial Investigation report will be accepted until the close of the comment period on the Feasibility Study report sometime in February 1985.

The Remedial Investigation report is essentially a data compilation. The next report, the Feasibility Study, will examine this data in relation to the nature and extent of contamination beyond the Western Processing site boundaries, as well as evaluate several examples of remedial action alternatives.

Copies of the Remedial Investigation report and the documents referenced in that report are available at the following libraries:

City of Kent Public Library
Reference Desk
232 South Fourth
Kent, Washington 98032
(206) 872-3330

U.S. EPA Regional Library
12th Floor
1200 Sixth Avenue
Seattle, Washington 98101
(206) 442-1289

A limited number of copies are also available from the EPA contacts listed below.

If you have questions about the report, please contact Judi Schwarz or Norma Lewis, both with the Superfund Branch, EPA Region 10, Seattle. They can be reached at (206) 442-2684 or (206) 442-7215, respectively.

Sincerely,

Philip S. Millam, Acting

for Robert G. Courson, Chief
Superfund Branch

Chapter 1
INTRODUCTION

The purpose of the Remedial Investigation (RI) at the Western Processing site was to gather additional data to supplement an existing data base acquired during previous investigations and to compile these previously collected data for use during the data analysis phase of the Feasibility Study. A description of these other investigations and the sequence by which they occurred is included in Chapter 4 of this report. Data gathered and compiled during this RI will be used to evaluate remedial response alternatives in the Feasibility Study. The RI activities were specifically directed toward gathering and reporting data that would:

- Improve knowledge regarding geology of the site, immediately adjacent to the site, and in the Kent valley plain
- Assist in the determination of groundwater gradients by measuring groundwater elevations
- Identify the zone of gross contamination within and surrounding the site by soil sampling
- Define potential contaminant migration pathways
- Identify land-use plans in the vicinity adjacent to Western Processing that might affect the selection of remedial actions
- Help evaluate potential health hazards resulting from exposure to contaminants
- Determine the quantity and characteristics of onsite materials

This report contains detailed discussions of the investigation tasks conducted to satisfy these data needs and those data gathered during these tasks.

PROJECT DESCRIPTION

The RI field activities included a site hydrogeologic investigation, soil sampling and analysis, a land-use evaluation, and an onsite materials inventory.

The site hydrogeologic investigation was conducted to provide data on soil substrata and groundwater on the site and adjacent to the site on all sides. The hydrogeologic investigation included drilling soil borings and installing monitoring wells and piezometers.

Soil samples were collected during subsurface drilling to identify the zone of contamination adjacent to the site. A field laboratory, the close-support lab, was set up at the site to test soil samples for selected contaminants found during previous investigations at the site. The presence or absence of these compounds was used to help guide the drilling program, to select samples for priority pollutant analysis at an EPA contract laboratory, and to permit a preliminary evaluation of the degree of offsite contamination.

A land use evaluation was conducted to identify current practices or future land development plans in the vicinity of the site that might affect the selection of remedial actions. Included in this task is the location of utilities near to the site that might act as pathways for contaminant migration.

The materials inventory was conducted by CH2M HILL and Ecology and Environment, Inc., to improve the data base regarding the types and quantities of materials on the surface of the site. This information is provided in a separate onsite Materials Inventory Report by CH2M HILL and is not discussed further in this report. At this time, all of the onsite materials above the ground surface have been removed. Data obtained during the materials inventory aided the surface clean-up effort and provided information regarding possible subsurface contamination for the remedial response alternatives evaluations.

The second major task of the RI was to compile data gathered during previous investigations. Several investigations for the Western Processing site were being conducted by other EPA contractors and were ongoing concurrently with the RI. These investigations include:

- Evaluation of the Kent Valley hydrogeology by Hart Crowser and Associates for GCA, Inc.
- Evaluation of aspects of Mill Creek surface water and sediment by GCA, Inc.
- Modeling of groundwater flow and contaminant transport by Battelle
- Evaluation of the asphalt cover effectiveness by JRB and Associates
- Assessment of surface water quality and wet weather-dry weather mass transport by Washington State Department of Ecology

Data accumulated during CH2M HILL investigations were made available to these contractors. The sequence in which these investigations took place and the availability of the results is included in Chapter 4.

Contacts with each of these companies and agencies can be made through EPA.

PROJECT ORGANIZATION

The primary participants in the remedial investigation were CH2M HILL and Ecology and Environment, Inc. CH2M HILL was responsible for overall project management, including tasks performed by Ecology and Environment. CH2M HILL performed all drilling activities, soil sampling, groundwater sampling, and all onsite materials identification and quantification. Ecology and Environment performed the majority of onsite waste materials sampling and chemical analysis.

QUALITY ASSURANCE AND DOCUMENTATION

A Quality Assurance Project Plan (QAPP) was prepared and approved by EPA before field activities were begun. The QAPP outlined procedures to improve the precision, accuracy, completeness, and representativeness of the data generated by the RI.

As outlined in the QAPP, detailed documentation procedures were followed throughout the investigation. A field notebook was used to record field activities, photo numbers, field observations, and other pertinent information. Sample containers were labeled immediately before sampling. The field label included the date, time of sampling, sampler's name, and a unique five-part sample number identifying the project, sample type, sample location, depth, and laboratory destination.

All samples collected during the field investigation were described and recorded in the field notebook. The samples were then taken to the field office for storage and shipment. Samples destined for the close-support laboratory were segregated and stored in a refrigerator until analysis. Samples destined for a contract laboratory were refrigerated until shipment. EPA chain-of-custody procedures were followed throughout the investigation.

Field procedures for decontaminating all sampling and drilling equipment were followed to minimize the possibility of cross-contamination. Drilling equipment was steam cleaned between borings, and soil sampling equipment was decontaminated with a trisodium phosphate wash followed by a tap water

rinse, an acetone rinse, and three distilled water rinses. Soil sampling equipment was air dried for several minutes between uses.

HEALTH AND SAFETY PRECAUTIONS

Onsite work required Level C protection at all times. The principal components of Level C gear include disposable coveralls, disposable booties, gloves, and an air purifying respirator. In addition, the concentration of organic vapors was monitored using an HNU photoionization detector.

Offsite work generally necessitated modified Level D protection, which was basically Level C protection without the respirator. While drilling and sampling SB-14 and SB-15, however, respirators were worn because organic vapors above background levels were present in the breathing zone.

Drill cuttings, purge water, and used disposable gear generated during the drilling of the monitoring wells, the shallow and intermediate soil borings, and the near-offsite piezometer were placed in labeled 55-gallon drums that were subsequently stored onsite on wooden pallets. A list of what the drums contained by number is presented in Appendix A.

These drums were disposed of at the CWM Arlington facility during the potentially responsible party's (PRPs) surface cleanup activities.

Chapter 2
HYDROGEOLOGY

INTRODUCTION

This section contains a description of the overall hydrogeologic environment in the Western Processing area and incorporates findings of the soils and hydrogeologic investigation into an understanding of local hydrogeology.

REGIONAL HYDROGEOLOGY

GEOLOGIC SETTING

Western Processing lies near the north-south axis of the Duwamish Valley, a physiographic subdivision of the Puget Sound Lowland (Luzier, 1969). The valley, once a marine embayment contiguous with Puget Sound, has been partly filled with Recent deposits. The east and west margins of the Duwamish Valley are defined by a dissected drift plain with elevations approximately 350-600 feet above the valley floor.

Consolidated rock in the area is exposed only where there are small outcrops of Tertiary extrusive and intrusive igneous rocks at the northern end of the valley. The uplands bordering the valley are composed of Pleistocene glacial and interglacial deposits. The valley fill is primarily a sequence of Recent alluvial and lacustrine deposits. Recent sediments are typically fine- to medium-grained sands, silts, peaty silt, and clay. The total depth of valley fill apparently exceeds 500 feet (Luzier, 1969).

OCCURRENCE AND FLOW OF GROUNDWATER

Groundwater in the area occurs primarily in unconsolidated fluvial, marine, lacustrine, and glacial deposits. The most productive aquifers are outwash deposits of the glacial drift that comprises the uplands. Groundwater in the valley floor is typically very shallow, with an average depth to water of less than 10 feet. The ground may become completely saturated in low areas during wet periods.

Confined groundwater occurs frequently in the area due to complex stratigraphy and generally fine grained sediments. A flowing artesian system, meeting part of the City of Kent's water needs, occurs at depths of less than 300 feet near the east and west valley margins.

Groundwater in the area is recharged primarily by precipitation in the uplands bordering the Duwamish Valley. Groundwater flow is toward the valley axis and northward toward

Puget Sound. Groundwater losses include discharge to stream channels and Puget Sound, spring discharges, and, to a much smaller extent, discharges due to pumping wells and evapotranspiration (Luzier, 1969).

SOILS AND HYDROGEOLOGIC INVESTIGATION

The soils and hydrogeologic investigation was conducted from May 7 to June 20, 1984. The four major tasks completed during this investigation are summarized below. The rational for drilling the locations and depths of these borings is discussed in Chapter 3 under Sampling Locations. Boring locations are indicated on Figures 1 and 2.

- Onsite monitoring wells. Three monitoring wells were installed on Western Processing property. Numbered MB-01, MB-02, and MB-03, the wells were drilled to 100, 60, and 100 feet, respectively.

- Offsite soil borings. Twenty shallow borings (SB-01 through SB-20), generally 30 feet deep, and three intermediate borings (IB-01 through IB-03), generally 60 feet deep, were completed adjacent to and surrounding the site.

- Deep stratigraphic boring. A 365-foot boring was drilled approximately 1/3-mile south of Western Processing (DB-01). This boring was backfilled and completed as a 155-foot well.

- Shallow piezometers. Eight shallow piezometers (PB-01 through PB-08), generally 16 to 18 feet in depth, were installed at distances of up to 1/3 mile away from the site.

ONSITE MONITORING WELLS

The three onsite monitoring wells were constructed under the field observation of a hydrogeologist. The wells were drilled with a cable-tool rig driving an 8-inch-diameter temporary steel casing with welded joints. Soil samples were obtained at 5-foot intervals with a standard 1-1/4-inch-diameter 18-inch split spoon sampler. Soil samples were photographed, inspected, and logged by the hydrogeologist, homogenized in a stainless steel bowl, and placed in sample jars. Three 8-ounce, wide-mouth glass jars with Teflon-lined plastic caps were used for each sample. Geologic logs for the monitoring wells are presented in Appendix B.

After MB-01 and MB-02 were drilled to their final depth, 4-inch, Schedule 40, PVC-slotted well screens and casings were placed inside the temporary steel casings.

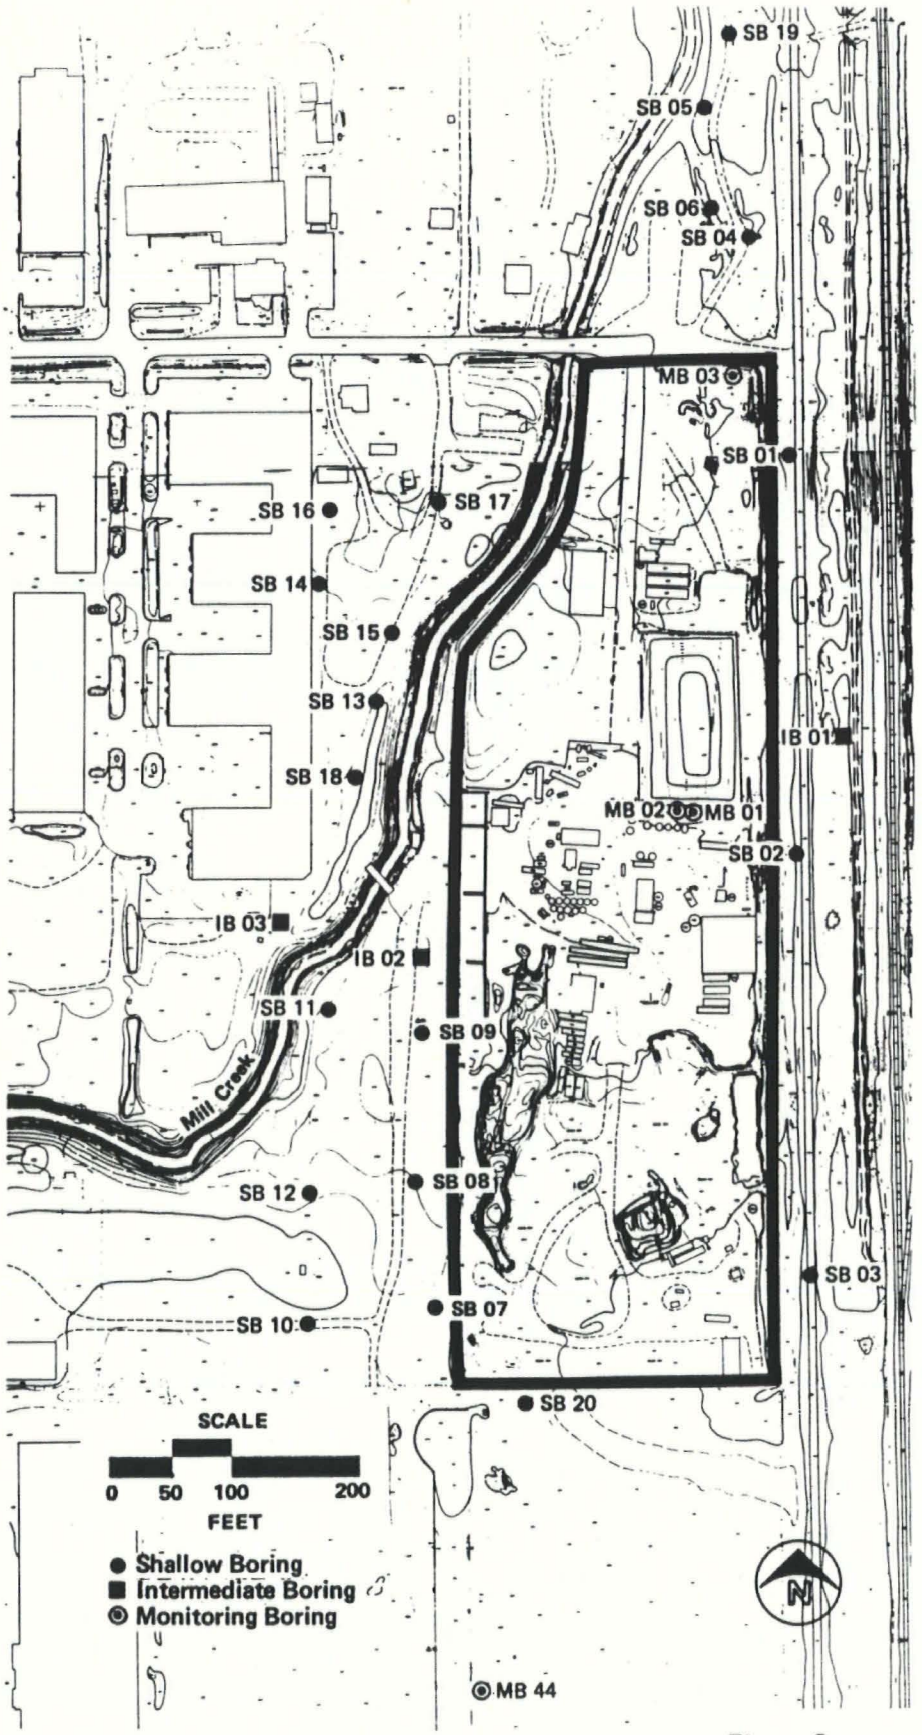

Figure 2
BORING LOCATIONS
WESTERN PROCESSING
Kent, Washington

The PVC screen and casing were joined with flush threaded joints. Solvents were not used. The well screens were sand packed as the temporary steel casing was pulled back. After the sand pack was installed to about 5 feet above the top of the screen a 2- to 3-foot bentonite layer was pumped in as a thick slurry. The remaining annular space between the PVC and steel casing was filled with a cement/bentonite grout pumped into the annulus through a drop pipe extending to the top of the bentonite layer. Grouting was continued as the remainder of the steel casing was withdrawn to ensure that the entire annular space was sealed.

A 6-inch-diameter, protective steel casing with locking cap was placed over the PVC casing and pushed 2 to 3 feet into the grout. MB-01 and MB-02 were developed by blowing compressed air through an airline lowered into the sump below the well screen. Development was determined to be complete when the return water became visibly less turbid. Development water was collected in drums. An electric submersible pump with a polyethylene discharge pipe was installed in each well. Well construction details and a representative well head are illustrated in Figures 3, 4, and 5.

A multiple-port (MP) well manufactured by Westbay Corporation of North Vancouver, British Columbia, was installed by Westbay representatives in MB-03. The MP system was chosen because it allows vertical gradients to be detected by measuring the potentiometric head at several depths in the same well. While it is theoretically possible to determine vertical variation in groundwater quality by sampling through ports located at various depths, because of low soil permeability at the MB-03 site it was difficult to adequately purge each port to draw a chemically representative groundwater sample. MB-03 is, therefore, of limited use in chemically profiling groundwater contamination. The primary benefit of this monitoring well's multiport system is to measure the vertical groundwater gradient.

MB-03 was installed by placing the multiple-port system inside the temporary steel casing and withdrawing the steel casing in several stages. The hole was selectively backfilled with alternating layers of coarse sand and a 2- to 3-foot-thick layer of bentonite pellets because it is important that each port be in hydraulic connection with a small, well defined section of the aquifer. This layering allowed each port to be sand packed, yet isolated from neighboring ports by bentonite. The Westbay MP well was developed by bailing from the drop pipe with only one port opened and with the water level in the pipe below the port opening. Construction details of the MP well are shown in Figure 6. Well head details are similar to those shown in Figure 5.

OFFSITE SOIL BORINGS

Twenty shallow soil borings (generally 30 feet deep) and three intermediate soil borings (generally 60 feet deep) were drilled in the immediate site vicinity by Subterranean, Inc., of Sumner, Washington. All soil borings were drilled with a 4-inch (I.D.) hollow stem auger and sampled with a 3-inch-diameter Dames and Moore split spoon sampler. Soil samples were collected at five-foot intervals as discussed in Chapter 3 Sampling Procedures.

The depth of the boreholes was a minimum of 29 feet for the shallow borings and 59 feet for the intermediate borings. Final depth was determined on the basis of readings from the HNU photoionizer. If organic vapors were detected at the minimum depth, drilling normally continued in 5-foot increments until they were no longer detected. At selected borings, drilling was continued beyond the minimum depth regardless of HNU readings. Borings into which drilling depth was increased beyond plan were selected upon evaluating contamination data issued by the close support laboratory from adjacent borings. This provided an additional check for contamination at greater depths.

All boreholes were sealed by pumping a cement/bentonite grout mixture through a drop pipe extending to the bottom of the auger. Grouting continued as the auger was withdrawn in 5-foot sections and each borehole was topped off with grout after removing the bottom auger.

Detailed geologic logs of all soil borings are presented in Appendix B.

DEEP STRATIGRAPHIC BORING

The deep stratigraphic boring was drilled using the cable tool method. A 12-inch-diameter temporary steel surface casing was driven to a depth of 20 feet, and an 8-inch-diameter steel casing with welded joints was used for drilling to the final depth. Cuttings were removed from the hole with a sand pump bailer.

A hydrogeologist logged information about the hole on the basis of intermittent observations, inspection of bailed cuttings, and consultation with the driller concerning drilling rates, heaving tendency, and water flow into the bottom of the casing. Representative samples of bailed cuttings were placed in labeled plastic bags for future reference. In addition, samples were collected in 8-ounce glass jars with Teflon-lined caps for analysis of background metal concentrations at the close-support laboratory. Samples for laboratory analysis were taken at 10-foot intervals to a depth of 100 feet, and 50-foot intervals to the final depth

of 365 feet. The geologic log for DB-01 is illustrated in Figure 7.

After drilling to the final depth, DB-01 was backfilled to the deepest sandy zone encountered during drilling, approximately 155 feet. A well was installed at that depth. The hole was backfilled with 50-foot layers of coarse sand separated by 2- to 3-foot-thick layers of bentonite. The bentonite was placed by mixing water and bentonite to a putty-like consistency and dropping balls of bentonite putty into the borehole. After settling, the bentonite balls were spread into layers by lightly tamping with the drill stem.

The well was installed by inserting a 10-foot-long, 6-inch-diameter (pipe size), wire-wrapped stainless steel well screen and pulling the 8-inch casing back to expose the screen. The screen was sealed with a neoprene Figure K packer. The 12-inch-diameter surface casing was withdrawn and the annulus grouted with a cement/bentonite slurry. A locking cap was installed on the well. Construction details are illustrated in Figure 7.

The deep offsite well was developed by surging and bailing approximately 850 gallons from the well. Turbidity decreased markedly while bailing.

SHALLOW PIEZOMETERS

Eight shallow piezometers were installed at distances up to 1/3 mile from Western Processing. The piezometers were drilled with a cable-tool rig driving an 8-inch-diameter temporary steel casing with welded joints.

The final depth of the piezometer borings was 5 to 10 feet below the observed or expected water table. After drilling was completed, 2-inch, Schedule 40, PVC-slotted piezometer screen and casing were placed inside the temporary steel casing. The screens were sand packed and the wells grouted in essentially the same manner as outlined for the monitoring wells, except that a one-foot layer of finer sand was placed between the coarse sand pack and the cement/bentonite grout to prevent the grout from invading the sand pack. Table 1 summarizes construction data for the piezometers. A representative piezometer is illustrated in Figure 8. The well head illustrated in that figure is representative of all the piezometer well heads except PB-03, which was completed at the ground surface with a locking steel cap inside a plastic water meter vault. Piezometer soil borings were not logged because the borings were relatively shallow (16 to 18 feet).

PIEZOMETER CONSTRUCTION DATA

Piezometer Number	Borehole Depth[a]	Screened Interval[a]
PB-01	18	14-16
PB-02	18	14-16
PB-03	18	14-16
PB-04	18	14-16
PB-05	17	13-15
PB-06[b]	16	12-14
PB-07	16	12-14
PB-08	18	14-16

[a]Feet below ground surface.

[b]Piezometer PB-06 has since been abandoned by EPA and sealed with grout.

An attempt was made to develop the piezometers by blowing compressed air through an air line lowered into the sump below the screen. Due to the low yield of the piezometers, however, development primarily consisted of bailing the sump of all sediments and then blowing one to three slugs of water out of the piezometers.

LOCAL HYDROGEOLOGY

LOCAL STRATIGRAPHY

Deposits underlying Western Processing exhibit complex small-scale stratigraphy. Sediments are generally fine-grained sands, silts, and clays. Silty sands and sandy silts are the most commonly encountered sediments. Sand grains in the area typically show three dominant colors: black, white, and reddish brown.

The five cross sections indicated in Figure 9 were determined on the basis of the boring logs presented in Appendix B. The cross sections are presented as Figures 10 through 14. Additional borings have been drilled at the site that have not been used in completing these cross sections. These boring logs will be reviewed and included in the feasibility study at a later data.

Portions of the site have been filled with a variety of materials. Battery fragments were reported by Wolf et al. (1982) to occur at depths of up to 24 feet below ground surface at well 22B, and black cinders were found at 15 feet

while drilling MB-03 during this investigation. Depth of fill is highly variable, however, and was absent from MB-01 and MB-02.

A clayey silt layer ranging from one to 15 feet in thickness underlies much of the site but is locally discontinuous. This layer is apparently most widespread in the northern part of the site at a depth of 5 to 15 feet.

A medium-grained sand layer ranging in thickness from 5 to 50 feet was encountered at roughly the 40- to 100-foot depth in some deeper boreholes. This layer was found to be extensive in wells drilled during the Interim Offsite Remedial Investigation, which had ten wells drilled 40 to 100 feet deep in an approximately 1,000-foot radius around the Western Processing site (see Chapter 4). This sand layer may be relatively continuous because of its thickness (CH2M HILL, 1983).

The deep stratigraphic boring (DB-01) encountered a 25-foot-thick sandy zone at a depth of 50 to 75 feet. This zone may be continuous with the sandy zone described above, but it is considerably siltier. Another major sandy zone was found at 110 to 150 feet below the surface. This zone is bounded on both sides by relatively impermeable clayey silts. The thickness of the lower clayey silt is undetermined, but it is known to extend to a minimum depth of 365 feet.

Of particular interest in drilling the deep boring was to find out if a productive artesian aquifer tapped by wells located near both the east and west valley margins was a single continuous aquifer across the valley. This confined aquifer was not penetrated by the deep boring.

Drilling in the deep boring was discontinued at 365 feet because it was felt that, in this location, if the artesian aquifer or some other nonartesian aquifer were located at greater depth, it was well protected from downward contaminant migration by the extensive clayey silt layer encountered from 150 feet on.

The presence of fine interlayered sands and silts in the site vicinity, each of which may be only an inch thick, were found in several boreholes both within the site and adjacent to the site during this study and in previous investigations. It seems unlikely that layers as thin as these could be continuous in an area as complex as the study area, but their frequent occurrence suggests that these interlayers persist over a relatively wide area. Moreover, it is possible that interlayering may have been overlooked in some boreholes because individual layers are so thin.

LOCAL OCCURRENCE AND MOVEMENT OF GROUNDWATER

Groundwater in the Western Processing vicinity generally occurs at depths of less than ten feet. The elevation of the water surface in wells constructed during this investigation is presented in Table 2. Elevation data for all borings are listed in Appendix C.

These elevations are based on a U.S. Coast and Geodetic Survey brass standard disk (C407 Reset 1968, elev. 25.75) located near the intersection of 68th Avenue South and South 204th Street, and a City of Kent benchmark (BM 56-5-3, elev. 24.55) located on a fire hydrant approximately 1/4 mile north of the disk.

Table 2
STATIC WATER LEVEL DATA

Well Number	Top of Casing Elevation[a]	June 22, 1984 Depth to Water	June 22, 1984 Water Elevation
MB-01	27.27	10.67	16.60
MB-02	27.23	10.48	16.75
DB-01	23.95	5.51	18.44

PB-04	28.15	12.44	15.71
PB-05	23.79	10.55	13.24
PB-06	25.77	8.58	17.19
PB-07	24.77	6.47	18.30
PB-08	27.08	8.10	18.98

[a]Elevation in feet above mean sea level at top of PVC casing; DB-01, elevation at top of steel casing.

Piezometer water elevations support data from previous investigations that the general groundwater flow direction is north-northwest. Local groundwater flow is influenced by the presence of a groundwater mound near the center of the site.

The groundwater mound has a downward vertical gradient. Water level data for MB-01 and MB-02 indicate a downward gradient between 60 and 68 feet of approximately 0.02 foot per foot for the mound near the center of Western Processing. Pressure measurements on the Westbay MP system (MB-03)

suggest a strong downward gradient to a depth of approximately 20 feet, with a much smaller but consistent upward gradient occurring from 20 to 85 feet. This trend is illustrated in Figure 15. Pressure differences between the lowest two ports indicate a slight downward gradient, but the difference is very small and may not reflect steady state conditions. The predominantly upward gradient occurring at depth supports the generally accepted concept that the Duwamish Valley is a regional groundwater discharge area.

While drilling monitoring well 19 (see Chapter 4), confined groundwater was encountered by Wolf et al. (1982) at a depth of approximately 8 feet. Water was reported to be flowing at the surface for a short time after penetrating a 2-foot-thick clay layer, but the excess head quickly dissipated and flow ceased. Confined groundwater under sufficient pressure to flow at the surface was not found in any borehole during this investigation.

The absence of confined groundwater under significant pressure in the deep boring is notable because it indicates that the artesian aquifer tapped near the valley margins may not be present beneath the center of the valley. If it is present, it occurs at depths greater than 365 feet below the valley floor and is separated from shallower aquifers by a layer of clayey silt at least 200 feet thick.

Chapter 3
INVESTIGATION OF SOIL AND GROUNDWATER CONTAMINATION

INTRODUCTION

Investigations were conducted during the Western Processing Remedial Investigation to help identify the zone of contamination surrounding the Western Processing site. Subsurface soil and groundwater samples were collected for analysis both on and off the site. The majority of soil samples collected were from offsite borings; however, subsurface soil samples were also collected during the installation of three onsite monitoring wells. In addition, groundwater samples were collected from the three onsite wells and two other offsite wells.

Soil samples were analyzed in three ways. Samples were first submitted to the CH2M HILL close-support laboratory (CSL) for field screening. Samples suspected of containing contaminants were submitted to the EPA contract laboratory program (CLP) for more detailed analysis. Samples not sent to the CLP remaining after CSL analysis were later submitted to the EPA Region X laboratory at Manchester for reanalysis of priority pollutants.

The information presented in this chapter includes all CSL, CLP, and Manchester data available as of December 1, 1984. Additional CLP and EPA Manchester data on samples that are to be submitted for reanalysis in the future will be made available to the public by EPA upon completion of analyses. This report includes discussions of the purpose and methods of field chemical analysis at the CSL, selection of sampling locations, and the sampling procedures. No interpretation of the data is provided. Data is intended solely for reference. Interpretation will be included in the Western Processing Feasibility Study Report.

CLOSE SUPPORT LABORATORY

A CH2M HILL CSL was located adjacent to the Western Processing site to provide field analytical data for soil samples collected during the drilling operation.

The purpose of the field laboratory was threefold. Samples were processed in the CSL to provide rapid data analysis to guide the drilling program. Samples found to contain significant contamination were sent to the CLP for priority pollutant organic and inorganic analyses. The CSL data also enabled a preliminary assessment to be performed of the extent of offsite contamination prior to receipt of the detailed CLP data. Finally, an added benefit of the CSL data was to enable an evaluation of the risk to personnel throughout the drilling and sampling operation.

Samples submitted to the CSL were analyzed for selected inorganic and organic contaminants found at the site during previous investigations. The presence or absence of the compounds was used as an indication of the presence of offsite contamination. Inorganic indicators included lead, zinc, total chromium, nickel, and cadmium. Organic indicators included methylene chloride, trichloroethylene, tetrachloroethylene, phenol, and bis(2-ethyl hexyl) phthalate. Method detection limits for each compound are provided on Table 3.

Table 3
CLOSE SUPPORT LABORATORY SOIL SAMPLE ANALYSES
METHOD DETECTION LIMITS

Category	Parameter	Method Detection Limit (µg/g wet weight)
Organics	Methylene chloride	1.5[a]
	Trichloroethylene	0.25
	Tetrachloroethylene	0.25
	Phenol	1.5
	Bis(2-ethyl hexyl) phthalate	0.25
Inorganics	Lead	2.5
	Zinc	1.0
	Total Chromium	0.3
	Nickel	0.6
	Cadmium	0.1

[a]Methylene chloride contamination was identified in the solvent used to extract the organics. Methylene chloride data were invalidated for this reason.

Soil samples were screened for organic constituents on a Hewlett-Packard model 5880A dual column, dual flame ionization gas chromatograph with an electronic integrator. The analytical procedure used for methylene chloride, trichloroethylene, and tetrachloroethylene was based on EPA Test Method 8010 (Halogenated Volatile Organics) and 3550 (Sonication Extraction). The analytical method used for phenol and bis (2-ethyl hexyl) phthalate was based on EPA Test Method 8040 (Phenols) and 8060 (Phthalate esters).

Organic samples were processed using a modified column isolation technique where one column was used to separate the volatiles (trichloroethylene, tetrachloroethylene, and methylene chloride) and the second column separated the

semi-volatiles (phenol and bis (2-ethylhexyl) phthalate). Detector output was automatically switched between columns to record the chromatographic output.

Soil samples were screened for metals on a Perkin Elmer model 303 atomic absorption system having a strip chart recorder. The analytical procedure used was based on EPA Test Method 3010 (Acid Digestion Procedure for Flame Atomic Absorption Spectroscopy), 7190 (chromium), 7520 (nickel), 7950 (zinc), 7420 (lead), and 7130 (cadmium).

Detailed analytical procedures used by the CSL for organic and inorganic testing are provided in the CH2M HILL Quality Assurance Project Plan for the Western Processing Remedial Investigation, May 1984 and are reprinted in Appendix D of this report.

Screening for these indicator compounds was done because high levels of each compound were previously reported in the Investigation of Soil and Water Contamination at Western Processing, King County, Washington, May 1983. Only the indicator compounds were analyzed because of limited analytical capabilities in the field laboratory.

In all, the close support laboratory performed approximately 225 organic and 275 inorganic analyses. A summary of all CSL data generated for the samples analyzed is provided in Appendix E of this report. Contaminant concentrations are reported on a wet weight basis.

SAMPLE NUMBERING

The sample designations used incorporated type of boring, sequence of boring hole, and depth of sample taken (in feet). Western Processing samples were further identified for the laboratory by beginning each sample number with the initials WP. The following list contains sample designations used:

SB = offsite shallow boring
IB = offsite intermediate boring
DB = deep stratigraphic boring
MB = monitoring boring
PB = piezometer boring

A typical sample number might be WP-SB-02-04 meaning Western Processing second shallow boring hole sample taken at 4 feet below surface. Samples further designated with A or B are replicates of a single sample.

SAMPLING LOCATIONS

Offsite shallow boring (SB) and intermediate boring (IB) locations were based on areas of suspected contamination and

possible migration routes. Monitoring borings (MB) were drilled onsite to investigate the extent of vertical contamination of soils on the site. Drilling locations were flexible and some drilling sites were determined at the time of drilling using data provided by the CSL. The boring locations are shown in Figure 2 in Chapter 2 and on Plate 2. Below is a brief description of the chosen drill sites.

SB-01, SB-02, and SB-03 were located along the eastern border of Western Processing. These drill sites were selected to evaluate possible eastward contamination migration that might affect an oil pipeline and bicycle route. One reason to suspect eastward contamination migration is the presence of two groundwater mounds on the site, identified during previous site investigations and verified with groundwater elevations and pressure measurements during this RI (see Chapter 2).

SB-04, SB-06, SB-05, and SB-19 are sampling sites located progressively north of Western Processing. This area is downgradient along a surface and groundwater migration route for contaminants.

SB-07, SB-08, SB-09, SB-10, SB-11, and SB-12 are located west of Western Processing and south of Mill Creek on property owned by Standard Equipment, Inc. This area may have received surface spills from overflows of wastes stored in onsite storage ponds. Subsurface contaminant migration toward this area is also possible.

SB-13, SB-14, SB-15, SB-16, SB-17, and SB-18 are located west of Western Processing and north of Mill Creek on property owned by Standard Equipment, Inc. The Liquid Waste Disposal Company (LIDCO) once ran a waste handling operation on this site. There is potential for contamination from this historic use of the site as well as potential from migration from Western Processing.

SB-20 is located directly south of the site to detect any potential contamination along the Standard Equipment "Railroad Spur" property.

IB-02 and IB-03 are located west of Western Processing, with IB-02 east of Mill Creek and IB-03 west of Mill Creek. IB-02 is in an area suspected of being contaminated from Western Processing because of local elevation and adjacent onsite treatment ponds. IB-03 was drilled subsequent to the finding of contaminants in IB-02 by the CSL to determine if Mill Creek created a barrier to contamination migration.

MB-01, MB-02, and MB-03 are located in the northern half of the Western Processing site. These deep wells were installed

to look for deep onsite soil and groundwater contamination and to serve as long-term wells to monitor site cleanup activities.

SAMPLING PROCEDURES

Subsurface soil samples were collected at 5-foot intervals to the completion of boring at all locations using a split-spoon sampler as described in Chapter 2. Split-spoon cores were blended in a stainless steel bowl to provide as many as four equivalent samples and submitted to the CSL, the EPA contract laboratory program, and properly owners requesting split samples for analysis. Detailed sampling procedures are provided in the CH2M HILL Quality Assurance Project Plan for the Western Processing Remedial Investigation, May 1984.

SAMPLE STORAGE

Jarred samples were transported from the drill rig to refrigerated storage upon completion of each boring. Samples were stored at 4 degrees C. Those designated for analysis at an EPA contract laboratory were kept in storage until shipment. Others designated for analysis at the CSL were removed as needed. Sample soils remaining after analysis were returned to the refrigerator for storage. Samples that were not analyzed, shipped, or those returned following analysis at the CSL remain in storage at this time and will be retained until it is determined unnecessary to continue to store them.

CONTRACT LABORATORY DATA REPORTS

Quality assured contract laboratory (CLP) data are summarized in Appendix F for inorganics and Appendix G for organics. Tentatively identified compounds (TICs) analyzed by the CLP are included in Appendix I.

DATA LIMITATIONS

CLOSE SUPPORT LABORATORY

Initially, the CSL attempted to analyze all submitted soil samples. However, as the drilling operation progressed, samples were often generated too fast for field analyses to be completed within an acceptable time period. Consequently, only those samples considered to be important by the field engineer to guide the drilling program were analyzed. Other samples were not analyzed at the CSL because of suspected high organic contamination. Chemists in the CSL found that samples having high levels of contamination caused unexpected equipment downtime. Rather than risk costly delays, samples suspected of high organics were not processed by the CSL but

were shipped to the CLP along with all other samples without prior analysis. Samples that were not processed were placed in refrigerated storage, as discussed above.

Because offsite soil samples revealed relatively low cadmium concentrations, cadmium analysis was eliminated midway through the investigation to allow laboratory staff and resources to concentrate on the remaining analyses. Methylene chloride results were disregarded after close support laboratory quality control checks revealed methylene chloride contamination in the solvent used for organic extraction.

CONTRACT LABORATORY PROGRAM

Quality assured contract laboratory data were found to contain higher than expected organic detection limits. This is because during a preliminary screening step high concentrations of unknown organics were found in the atomic mass range associated with priority pollutants and the samples were subsequently diluted prior to GEMS analysis. In order to maximize the usefulness of the organics data package, selected samples remaining in storage were removed and submitted for additional analysis to the EPA laboratory in Manchester, Washington. For the most part, these samples consisted of sealed 8-ounce jars of soil remaining after completion of analysis at the close support laboratory. These data, as of December 1, 1984, are included in Appendix H.

BACKGROUND CONCENTRATION OF INORGANICS IN SOILS

Background soil samples were collected to enable a comparison of subsurface metal concentrations near the site to metal concentrations found in soils from the region. Soil samples were analyzed for background inorganics from the deep boring down to a depth of 355 feet below the ground surface. In addition, seven surface soil samples (BG) were collected from vacant lots away from major transportation routes from beneath the surface grass using a stainless steel trowel. Soil samples were placed directly into decontaminated 8-ounce glass jars. These data are summarized in Table 5. For comparison purposes, world wide background metal concentrations reported in the literature are provided on Table 6.

Table 5

Chapter 4
SUMMARY OF ADDITIONAL SITE DATA SOURCES

INTRODUCTION

Considerable data regarding the nature and extent of contamination at the Western Processing site and its vicinity are available in numerous sources other than this RI report. The purpose of this chapter is to advise the reader of these data sources, their availability, and to provide the chronology of events associated with these reports (Figure 16). Several smaller documents and data not easily obtainable have been reprinted in the appendixes of this report. Other documents are available through the EPA, as discussed in the text. Still other data may be available from interested local parties such as neighboring property owners who had samples analyzed on their own.

The referenced reports have been divided into two categories: Soil, Groundwater, and Surface Water Contamination Data; and Hydrogeologic Data. All sampling locations associated with these data are presented in Plates 1, 2, and 3. (Plates 1, 2, and 3 are located in a pocket at the end of this document, as issued December 12, 1984, and subject to revision.) Plate 1 summarizes all surface soil, surface water, and sediment sampling locations. Plate 2 identifies the locations of all groundwater monitoring wells installed to date, and Plate 3 shows all subsurface soil sampling locations including those from the 1984 remedial investigation.

SOIL, GROUNDWATER, AND SURFACE WATER CONTAMINATION DATA

1. Municipality of Metropolitan Seattle (Metro). RAMIX II Data Base System. Surface Water Quality Data Collected Along Mill Creek. (unpublished) 1977 to 1981. (Appendix J)

   Water quality data were collected on Mill Creek downstream from Western Processing at South 196th Street, Kent (Metro Station E317), from September 1977 to June 1981. Analyses included standard water quality monitoring variables such as temperature, dissolved oxygen, fecal coliform, pH, and selected metals. Mill Creek, upstream of Western Processing (Metro Station X317), was sampled twice in June 1981 and analyzed for metals. A comparison of metal results from upstream and downstream

stations in June 1981 shows higher concentrations of cadmium, copper, nickel, zinc, and iron in the waters downstream of Western Processing. Metro also collected water quality data from the Black River, downstream from the confluence of Mill Creek, near Longacres Racetrack (Station 0317) from 1977 through the present. Sampling locations of E317 and X317 are shown in Plate 1.

2a. Washington State Department of Ecology. Miscellaneous Water Quality Data for Mill Creek and Vicinity. (unpublished) 1981 to 1982. (currently unavailable)

During 1981 and 1982 Washington DOE collected water quality data from Mill Creek near Western Processing. These data have been summarized and sampling locations identified as part of the surface water quality report currently being prepared by GCA, Inc., an EPA contractor. This report is expected to be available through U.S. EPA Region X library after its completion.

2b. Washington State Department of Ecology. Storett Data Base. Monthly Ambient Water Quality Sampling Program, Mill Creek Sampling Sites. No. 09E090 and No. 09E070. April 1984 to November 1984. (Appendix K)

Washington State DOE has an ongoing water quality sampling program near Western Processing upstream, on West Valley Highway, R.M. 5.8 (Station No. 09E090) and downstream, at Orillia, R.M. 4.3. (Station No. 09E070). Standard DOE water quality variables are analyzed including temperature, pH, dissolved oxygen, nutrients, as well as selected priority pollutant metals and organics. Sample site locations are shown on Plate 1.

2c. Yake, William. Washington State Department of Ecology. Personal Communication. October 24, 1984. (currently unavailable) (not shown in Figure 16)

There is an ongoing survey being conducted in Mill Creek to determine wet weather versus dry weather water quality conditions. Data collected during this study will not be available until the report is finalized. Standard DOE water quality analyses are included at five sampling stations with some overlap of data with the ongoing monthly ambient water quality monitoring program.

3. U.S. Environmental Protection Agency, Region X. Report of Western Processing Vicinity Survey. May 20-21, 1982. Published June 1982. (Appendix L)

Surface water and sediment samples were collected from locations along Mill Creek to determine existing conditions upstream, adjacent to, and downstream of the Western Processing site. Sediment samples were collected from all four sides of the property to characterize past or present drainage influences. Surface water samples were taken from standing water south of the site, as well as several points in Mill Creek and the east drainage ditch. Well point samples were taken of the interstitial groundwater directly beneath the Mill Creek stream bed at points upstream, downstream, and adjacent to Western Processing, and also in an intermittent pond area north of the site. Sampling locations are shown on Plate 1. Samples were tested for inorganic and organic priority pollutants.

4. U.S. Environmental Protection Agency, Region X, Environmental Services Division. Investigation of Soil and Water Contamination at Western Processing, King County, Washington, Parts I and II. May 1983. (available at the Kent library and U.S. EPA Region X library)

The nature and extent of onsite contamination at the Western Processing facility were investigated by the EPA between September and November 1982. A total of 30 onsite and near-offsite groundwater monitoring wells were installed. In addition, seven surface soil and another nine auger samples were collected. The locations of all monitoring wells installed are provided on Plate 2. The locations of surface soil and auger samples are provided in the above-referenced report.

Significant levels of many toxics were found in soil and groundwater samples. A total of 87 priority pollutants were identified on or near the site, 67 of them in quantifiable levels. Groundwater and soils data from offsite wells suggested contaminant migration from the site.

Groundwater elevation data were used to prepare a groundwater contour map for the site. Two groundwater mounds were identified beneath the site. A summary of the static groundwater elevations in

these and other wells currently existing near Western Processing, has been included as a later reference in this chapter.

5. U.S. Environmental Protection Agency, Region X. News Release on Groundwater Contamination Data. September 26, 1983. (available at the Kent library and U.S. EPA Regional X library).

   A news release by EPA was issued to provide the public contamination data on groundwater samples collected in the summer of 1983. These data are available at the Kent library or through the U.S. EPA Region X library.

6. CH2M HILL. Interim Offsite Remedial Investigation Report. Western Processing, Kent, Washington. Prepared for EPA WA 37-0L16.0, 100 pp. October 1983. (available at the Kent library and U.S. EPA Region X library) (see following description)

7. U.S. Environmental Protection Agency, Region X. Western Processing Alternatives Assessment Study, 1983 Data Report. April 1984. (available at the Kent library and U.S. EPA Region X library)

   An Interim Offsite Remedial Investigation was conducted by CH2M HILL in August and September 1983 in order to gather data on the nature and extent of offsite contamination. Information generated during this investigation was compiled in the two documents listed above.

   The scope of work for the Interim Offsite RI included the installation of wells and sampling of soils and groundwater at 10 offsite groundwater monitoring wells (MW-35 through 44) and the collection of 30 surface soil and sediment samples. Subsurface soil samples were collected during the monitoring well installation. Sampling locations are shown on Plates 1 and 2.

   The Interim Offsite Remedial Investigation Report contains data on the sampling protocols, sample locations, summaries of well construction, geology, OVA field results, the geologic boring logs, and OVA chromatograms and field data sheets.

   The Alternatives Assessment Study (AAS) includes the EPA contract laboratory data generated from the analysis of soil and groundwater samples taken during the construction of the monitoring wells and during the sampling of Mill Creek, offsite

ponds, and drainage ditch sediment samples. The AAS also includes water level data, pump test results, well construction details, geology information, and pH and conductivity profiles. No interpretation of the data was provided in either report.

8. U.S. Environmental Protection Agency, Region X, Environmental Services Division, Field Operations and Technical Support Branch. Water Quality Data for Mill Creek Survey. (unpublished) January 1984. (Appendix M)

   Surface water and sediment samples were collected in Mill Creek in January 1984 at the same stations tested in May 1982 to provide a comparison with past and present conditions. Samples were tested for inorganic and organic priority pollutants. Metal loadings were calculated for Mill Creek using January 1984 and May 1982 survey results. Sampling locations are shown in Plate 1.

9. U.S. Environmental Protection Agency. Memorandum from Spencer A. Peterson, Hazardous Materials Assessment Team, to Bob Courson, Region X, Environmental Services Division. Preliminary Bioassay Results on Western Processing Samples Submitted to CERL. No date. (available from the Kent library and U.S. EPA Region X library)

   Four onsite locations at Western Processing, Kent, Washington, were sampled for soil at 3-, 6-, and 9-foot depths. (Sample locations are shown in Plate 1.) Elutriates were prepared from these soil samples for bioassays using algae-growth, daphnia mobility, microbial activity, seed germination and root elongation, and earthworm response as indicators of acute environmental toxicity. Additionally, direct soil assays of each of 12 soil samples were conducted using earthworms. Test results were reported as percentages of elutriate (or soil sample) which caused 50 percent lethality. Metals and selected organic compounds were analyzed in soil from the 12 soil sampling locations as well as water from adjacent shallow wells.

   Soil elutriates from study site 17, located near the middle of the facility, were observed to have the highest toxicities. An increase in toxicity with depth was noted at this site for algae, microtox, seed germination and root elongation, and earthworm soil assays. The remaining site, study site 11, had a higher bioassay toxicity

potential than 22, which had a higher potential than 1. Overall, aquatic algae and daphnia mobility were found to be the most sensitive in these soil elutriate tests, indicating the susceptability of the aquatic ecosystem to substance from this site.

These preliminary results indicate that there are biologically available water soluble substances present in subsurface soils of the Western Processing site which cause significant adverse impacts to test organisms.

10. Miller, W., S. Peterson, J. G. Greene, and C. A. Callahan. Draft Report. Comparative Toxicology of Hazardous Waste Site Bioassessment Test Organisms. U.S. Environmental Protection Agency, Corvallis Environmental Research Laboratory, Corvallis, Oregon. September 1984. (available at Kent library and U.S. EPA Region X library)

    An array of bioassays was conducted using microbes, plant roots, algae, daphnia, and earthworms to test toxicities of the following chemical subgroups: heavy metals (copper, cadmium, zinc); herbicides (2,4-D, Esteron 99); and insecticides (aldrin, dieldrin, endrin, chlordane, heptachlor). For comparison, soil, soil elutriates, and surface waters were obtained at five sites around the Western Processing facility and were used in the same bioassay procedure. (Sample locations are shown in Plate 1.) The purpose of these tests was to examine the applicability of using multi-media and multi-trophic bioassays in determining extent and severity of environmental contamination at hazardous waste sites.

    The EC50 response of some test organisms for several of these chemicals and metals is known; however, little information is available on the toxicity potential of complex mixtures of chemicals found at hazardous waste sites. The investigators conclude that the multi-media and multi-trophic bioassay procedure is a more realistic indicator of the environmental hazard potential presented at hazardous waste sites.

11. Schmidt, C. E., R. Vandervort. Summary of the Nature and Extent of Contamination Present on Standard Equipment, Inc., Property in Kent, Washington. Radian Corporation, Sacramento, California. October 1984. (available through Standard Equipment, Kent, Washington, or the Radian Corporation)

An investigation of contamination on Standard Equipment, Inc., property adjacent to Western Processing on the west side of the site was conducted by the Radian Corporation in cooperation with CH2M HILL and the EPA. Subsurface soil samples collected during the drilling of soil borings by CH2M HILL on Standard Equipment, Inc., property during the summer 1984 remedial investigation were provided to Radian for their use. Additional surface soil, sediment, and water samples were collected by Radian independent of EPA and CH2M HILL activities. Samples were analyzed by Radian and the data summarized in the referenced report.

HYDROGEOLOGICAL DATA

CH2M HILL reviewed EPA files to gather groundwater data for wells at Western Processing. Groundwater elevations are summarized in Table 7. The screened interval for each well is also included.

1. Ecology and Environment, Inc. Memorandum from Stephen Testa and Katherine Lombardo to John Osborn, EPA. Installation of Four Groundwater Monitoring Wells, Western Processing Company, Kent, Washington. TDD RIO-8302-03. June 8, 1983. (available at the Kent library and U.S. EPA Region X library)

   This memorandum contains boring logs from the installation of four groundwater monitoring wells that were drilled offsite at Western Processing from April 18 through June 3, 1983. Volatiles were monitored using an HNU photoionizer; however, data are not included in this report. Preliminary OVA analyses on water samples obtained from the installed wells were used to better define the placement of monitoring screens. Soil samples were obtained continuously to a depth of 40 feet, and at 5-foot intervals thereafter. Subsurface soil conditions were described and entered in the boring logs. A gamma log survey was conducted on DW-31 with no detectable differences found between subsurface materials.

2. Bond, F. W., C. M. Smith, J. M. Dowsburg, C. J. English. Application of Groundwater Modeling Technology for Evaluation of Remedial Action Alternatives, Western Processing site, Kent, Washington. Prepared by Battelle Project Management Division, Office of Hazardous Waste Management, for U.S. Environmental Protection Agency, Office of Research and Development, Municipal Environmental Research

[b]Water level indicator would not fit into well.

[c]Depth range represents the length of sand pack at each sampling port.

Laboratory, Cincinnati, Ohio. September 1984. (available at the Kent library and U.S. EPA Region X library)

A conceptual model of the groundwater flow system in the vicinity of Western Processing was developed based on available hydrogeologic data developed during the 1982 EPA Investigation of Soil and Water Contamination at Western Processing, King County, Washington and the Interim Offsite Remedial Investigation (see the Western Processing Alternatives Assessment Study, April 1984). Numerical flow and contaminant models were developed and calibrated using existing trichloroethylene concentrations from the two above-referenced documents. Six selected remedial action alternatives for the site were evaluated using the calibrated flow and contaminant transport models.

3. Hart Crowser and Associates, Inc. Final Report Hydrogeologic Assessment Western Processing, Kent, Washington. Prepared for GCA Technology Division, Bedford, Massachusetts. EPA No. 68-01-6769. October 16, 1984 (available at the Kent library and U.S. EPA Region X library)

A hydrogeologic assessment of the Kent Valley and the Western Processing site was developed. Work included compiling and preparing a bibliography of available data related to hydrogeology, contaminant sources, and contaminated media. The available information was assessed for data gaps regarding the Kent Valley hydrogeology, contaminant sources, and contaminated media as well as factors affecting pollution migration mechanisms and pathways. The report includes monitoring well static water level elevations for onsite and offsite wells from November 1982 to July 1984. Also included are local and regional geologic cross sections, well location maps, groundwater contour maps, and various summaries of onsite and offsite contaminant data.

Chapter 5
UTILITIES AND LAND USE

INTRODUCTION

A utility and land use evaluation was conducted to obtain information regarding utilities adjacent and within the site for incorporation into the feasibility study. Information was also obtained in hopes of identifying possible future maintenance activities by these utilities planned in potentially contaminated areas. That information would be made available to the utilities so that they could be aware of potential health and safety risks. The information obtained is summarized in the following sections.

UTILITIES

The following is a discussion of the utilities adjacent to and within the Western Processing site. This information was obtained from representatives of the individual utilities. The underground utilities described below are shown on Figure 17.

In the 1950's the site was used as a anti-aircraft battery. Onsite utilities in place at that time consisted of sewer, water, storm drainage, and power. Current information indicates that most of these utilities were left in the ground when the military withdrew. The only utility extending offsite which was identified from drawings of the site is the sanitary drainfield line shown in Figure 17. It is not known whether this drain still exists or whether it has been blocked off.

NATURAL GAS

Washington Natural Gas Company has a 4-inch steel-wrapped gas pipeline in South 196th Street adjacent to the Western Processing site. The pipe lies 14 feet north of the centerline at a depth of approximately 3 feet. Typically, the gas company lines are excavated only if they have ruptured or if they are to be replaced. The gas company does not anticipate excavating the line in South 196th for any of these reasons.

TELEPHONE

Pacific Northwest Bell (PNB) Telephone Company has a duct structure buried in South 196th Street adjacent to the Western Processing site, approximately 13 feet south of the centerline. The structure extends east and west along South 196th Street at a depth of approximately 40 inches (to the top of the structure). Approximately 130 feet west of the

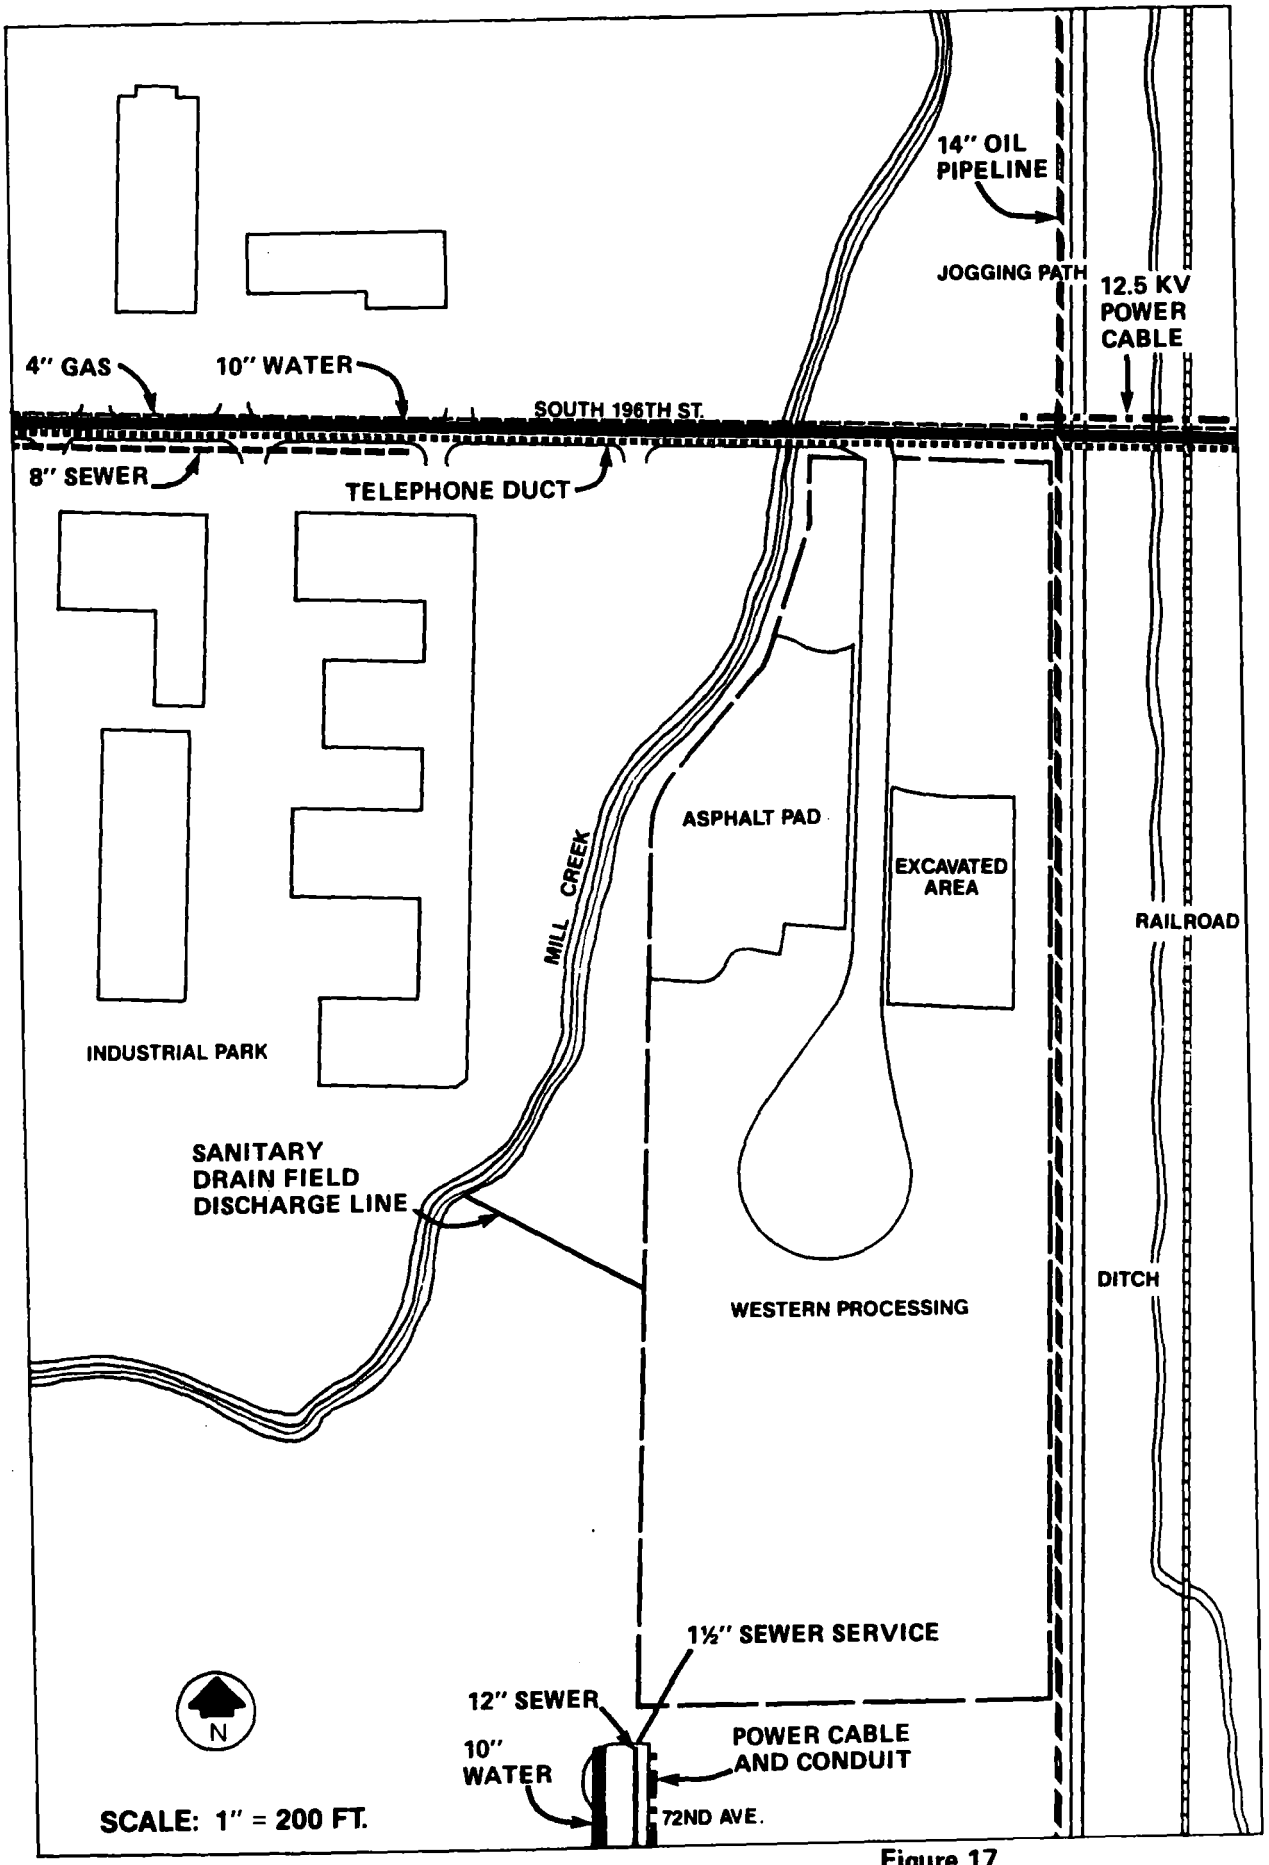

Figure 17
UNDERGROUND UTILITIES
WESTERN PROCESSING
Kent, Washington

railroad tracks adjacent to the site is a telephone company manhole structure that straddles the duct structure. The manhole cover is visible in the street.

The duct structure consists of twelve 4-inch PVC conduits encased in concrete. Eight of the conduits contain cables and four are empty. The cables include trunk cables, tie cables, a Boeing Company circuit, and two fiber optics systems. One of the fiber optics systems is the largest such system PNB has in the area.

The duct structure was constructed by excavating a trench approximately 3 feet wide and 5 feet deep. The conduits are stacked directly in the trench (no gravel base) in rows of three, and the concrete is poured over them. The resultant duct structure is approximately 2 feet high and 15 inches wide. Because the cables may spread when the concrete is poured, the structure should be assumed to be as large as 30 inches high and 24 inches wide for the purpose of planning other underground work in the area.

The manhole structure is precast concrete approximately 10-1/2 feet long, 5 feet wide, and 6-1/2 feet high. It is buried approximately 3 feet below the surface.

At this time, there are no plans to run cables in the four empty conduits. They are available to provide future service as the area is developed. When they are filled, the work will be undertaken by running the cable between manholes. Excavation will not be necessary.

A PNB representative indicated that one of the pressurized cables in the duct structure is experiencing air loss near the site. At this time, it is not affecting the operation of the cable. After remedial work is complete at the Western Processing site, PNB plans to investigate the problem. No other work on their equipment is planned at this time.

POWER

Puget Sound Power & Light (PSP&L) has both overhead and underground utilities adjacent to the project site. The overhead equipment consists of three sets of poles in the PSP&L right-of-way adjacent to the site. On these poles there are four sets of wires, one set of 230-kV transmission lines, two sets of 115-kV lines, and one set of 12.5-kV distribution lines. On the north side of South 196th Street, there is one set of 12.5-kV distribution lines. This set of lines goes underground about 50 feet west of the western boundary of the Puget Sound Power & Light easement.

Underground power in 72nd Avenue South, south of the Western Processing site, consists of three 12.5-kV cables, two

6-inch PVC conduits and one 4-inch PVC conduit (all conduits are empty), and 120-volt street light wire. All cables, wire, and conduit are located in the same trench, approximately 10 feet behind the curb on the east side of the street. The system was installed approximately 6 months ago to serve the Corporate Properties Investors development on 72nd Avenue South and other future development in the area.

PSP&L has no plans to replace or supplement their existing equipment in the area. When additional development is proposed in the area, the empty conduits in 72nd Avenue South may be filled.

OIL

The Olympic Pipeline Company has a 14-inch-diameter pipe located approximately 5 feet east of the fence along the eastern boundary of the Western Processing site. The company does not keep records of the depth of the pipeline.

The pipe is solid steel with welded joints, coated with cold tar enamel and wrapped with asbestos felt and fiberglass. Electric corrosion control is provided by d.c. voltage. The pipe carries refined petroleum products under pressure.

At this time, Olympic Pipeline Company does not plan to excavate their line. About 1 to 2 years ago, they checked the oil coating on the line. Because it was in good condition, they assume corrosion agents are not reaching the steel pipe.

SEWER AND WATER

A 12-inch city sewerline extends toward the site and ends at a manhole near the north end of 72nd Avenue South. This line is located about one foot west of the 72nd Avenue centerline. An unauthorized connection was made to this sewer with a 1-1/2-inch line from the Western Processing site.

An 8-inch city sewer line is located in South 196th Street about 15 feet south of the south edge of the pavement. This line stops approximately 500 feet west of the Western Processing site. The City of Kent has unconfirmed information that there may have been an unauthorized connection to this line from the Western Processing site. In addition, there is currently in place a temporary legal connection for discharging treated stormwater to the sanitary sewer on South 196th Street. This discharge is being made by an independent contractor currently working on a surface cleanup of the site. This connection is a 3-inch PVC pipeline which connects to the 8-inch sanitary sewer approximately 100 to 150 feet west of the main entrance to the site.

A 10-inch waterline is located approximately 25 feet west of the centerline in 72nd Avenue South. This line provides service to the warehouse and office of the Corporate Properties Investors (CPI) development west of 72nd Avenue South.

A 10-inch waterline is also located in South 196th Street about 16 feet north of the centerline. This line provides service to the Western Processing site at two locations and to the residence across South 196th Street from the Western Processing site.

There are no plans to extend the sewerlines and waterlines at this time. Extensions will be made if 72nd Avenue is continued or when new development in the area requires service.

DEVELOPMENT REGULATIONS

ZONING

The Western Processing site and the property to the north and south are zoned M-2, limited industrial district. Property to the west is zoned M-1, industrial park district, and to the east the property is zoned M-3, general industrial district (see Figure 18).

Table 8 lists the uses that are allowed in the Kent industrial districts. In general, the uses allowed in each of the industrial districts are similar. However, in addition to the uses allowed in the M-1 and M-2 districts, more intensive industrial uses (not shown in Table 8) are also allowed in the M-3 zone. These include sawmills, truck storage yards, electroplating, and transit terminals.

Table 9 shows the development standards for each of the industrial zones. The development standards are the most strict in the M-1 zone where light industries and nonnuisance uses are encouraged. The M-3 zone has the least restrictive development standards.

These development standards, shown in Table 9, would apply to development of the Western Processing site (M-2 standards) and to development of the adjacent properties.

COMPREHENSIVE PLAN

The Kent Comprehensive Plan consists of a citywide comprehensive plan and three subarea plans. The citywide plan contains statements of goals and policies describing the character of future development and a comprehensive plan map that is intended to guide future development patterns. The subarea plans have more specific goals and policies for development in particular areas.

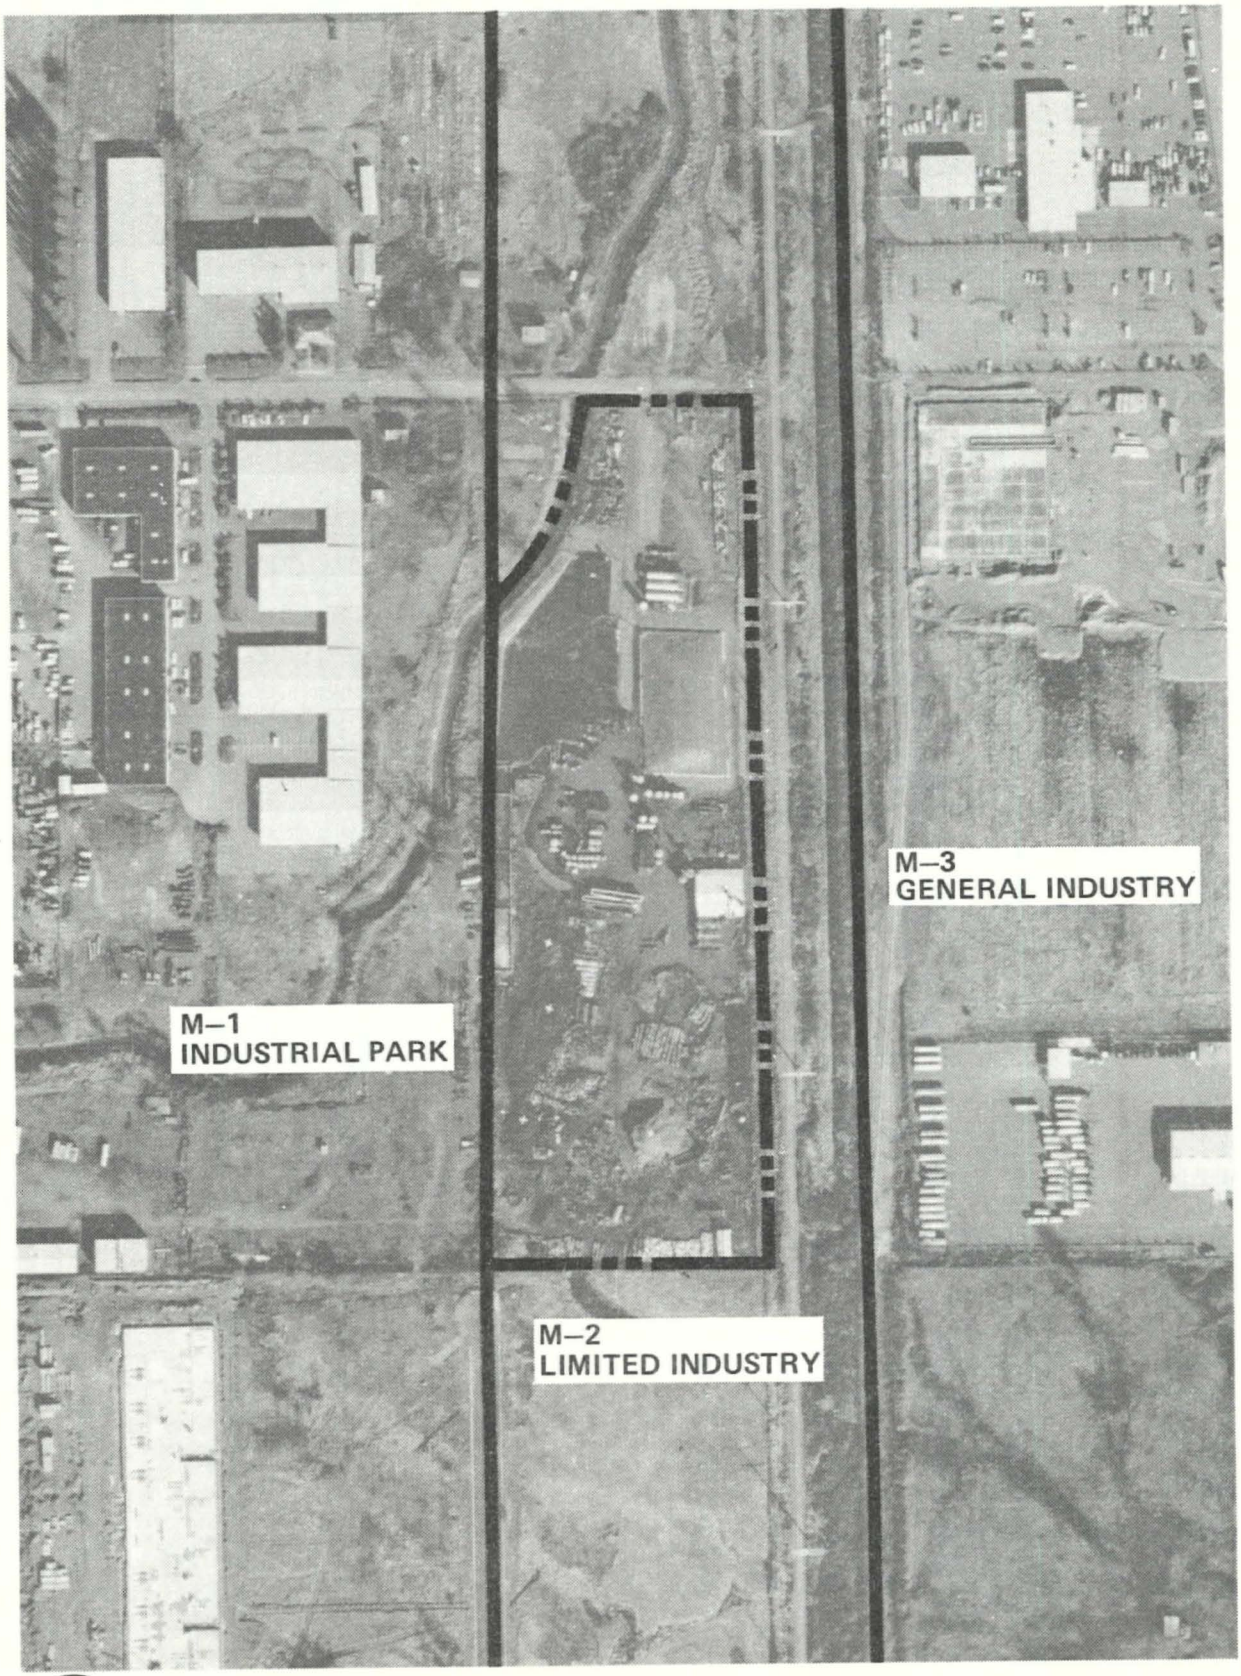

Figure 18
ZONING CLASSIFICATIONS

WESTERN PROCESSING
Kent, Washington

Table 8
USES ALLOWED IN THE INDUSTRIAL DISTRICTS
M-1, M-2, and M-3

A. Principally Permitted Uses

Manufacturing, processing, treating, assembling, and packaging of a variety of products

Printing, publishing, and allied industries

Warehousing and distribution

Crop and tree farming

Administrative or executive offices

Scientific laboratories

Warehousing with retail sales

B. Accessory Uses

Repair operations and commercial sales incidental to the principally permitted use

Dwelling units for maintenance and security personnel only

Employee recreation facilities

Restaurants or cafeterias in conjunction with principally permitted use

Temporary buildings during construction of permanent buildings

C. Conditional Uses

Commercial office, retail, and service uses intended to serve the M-2 district

Utilities and communication facilities

Public facilities

Table 9
INDUSTRIAL DISTRICT DEVELOPMENT STANDARDS

	M-1 Industrial Park	M-2 Limited Industrial	M-3 General Industrial
Minimum lot size	One acre	20,000 square feet	15,000 square feet
Maximum site coverage	60 percent	65 percent	75 percent
Front yard setback	20 percent of lot depth	15 percent of lot depth	10 percent of lot depth
Side yard setback	10 percent of lot width (total). Minimum 15 feet per side.	10 percent of lot width (total). Minimum 10 feet per side.	10 percent of lot width (total). Minimum 10 feet per side.
Rear yard setback	None required	None required	None required
Height limit*	Two stories (35 feet)	Two stories (35 feet)	Two stories (35 feet)

*May be increased by increasing yard area.

The Western Processing site lies within the valley floor subarea. The site and the property to the north, south, and east are designated for industrial use in the comprehensive plan. The property to the west is designated for light industry. These designations are consistent with the current zoning designations in the area shown in Figure 18. The City of Kent is not anticipating or planning a change in present development patterns in the area as represented by zoning and existing uses.

The main planning issues in the valley floor subarea plan that relate to the Western Processing site are:

- Providing storm drainage and retention systems that use the natural drainage system
- Restoring, preserving, and enhancing water quality and biotic habitat
- Developing land uses compatible with existing bike trail systems

These issues are described in the goals and objectives of the valley floor subarea plan and will be used to evaluate development on the Western Processing site and adjacent property when development is proposed.

STORMWATER

The City of Kent engineering department has been studying flooding problems and stormwater management in the Kent Valley for several years. Flooding has always occurred in the valley, partly because the valley is the natural flood plain for the Green River, and also because of saturated soils in the valley, a high water table, and insufficient capacity in the present drainage system. According to the City of Kent, flooding has been aggravated by increased stormwater flows into the valley from development of the East Hill area.

In the early 1960's, the Soil Conservation Service (SCS) developed a flood plain plan for the valley that involved major widening of Mill Creek. The City of Renton has constructed portions of this plan, but at this time, the City of Kent does not expect to implement the SCS flood plain plan. The federal government will pay for the actual construction costs of implementing the plan, but not the cost of acquiring the property adjacent to the stream segments to be widened. The City of Kent believes this part of the project will be too costly for the City to undertake.

The City of Kent is analyzing several alternatives for controlling stormwater and expects to make a recommendation to

the city council for adoption of a plan this fall.[1] The preferred alternative at this time involves using an existing, but unused treatment plant (about 2 miles south of the Western Processing site) for stormwater detention and diverting flows from Mill Creek into the storage facility during periods of high flows. Other alternatives involve removing channel constrictions, reconstructing and widening portions of the channel banks, and providing other regional storage facilities. The Western Processing site could be affected by channel modifications although the exact location of possible channel widening to increase its capacity has not been determined.

The current City of Kent Surface Water and Drainage Code (Ordinance No. 2130) is designed to reduce peak stormwater flows from new development. The ordinance applies to all projects that require city permits, such as a grading permit or substantial development permit (shoreline development permit). The ordinance requires that stormwater retention and detention facilities are provided to handle stormwater volumes generated during a 25-year storm, and discharge from the site is to be limited to the predevelopment release rate during a 10-year storm (storm duration is designated by the public works department).

The current stormwater ordinance was substituted by a more strict, temporary ordinance between October 1982 and October 1983. This ordinance was in place while stormwater management studies were being undertaken by the City of Kent. The current ordinance may be revised following the adoption of an alternative from the Stormwater Drainage Master Utility Plan.

LAND USE

OWNERSHIP AND EXISTING DEVELOPMENT

Figure 19 shows the ownership and land use of the parcels immediately adjacent to the project site. The privately owned developments are primarily light industry and warehouses. Publicly held land includes street rights-of-way and the interurban bike trail. In addition, there are several vacant adjacent privately-owned properties.

FUTURE DEVELOPMENT PLANS

Private development projects adjacent to the site are generally being delayed until the extent of offsite contamination

[1]The analyses of the stormwater alternatives are contained in Draft Storm Drainage Master Utility Plan, URS Engineers, 1984.

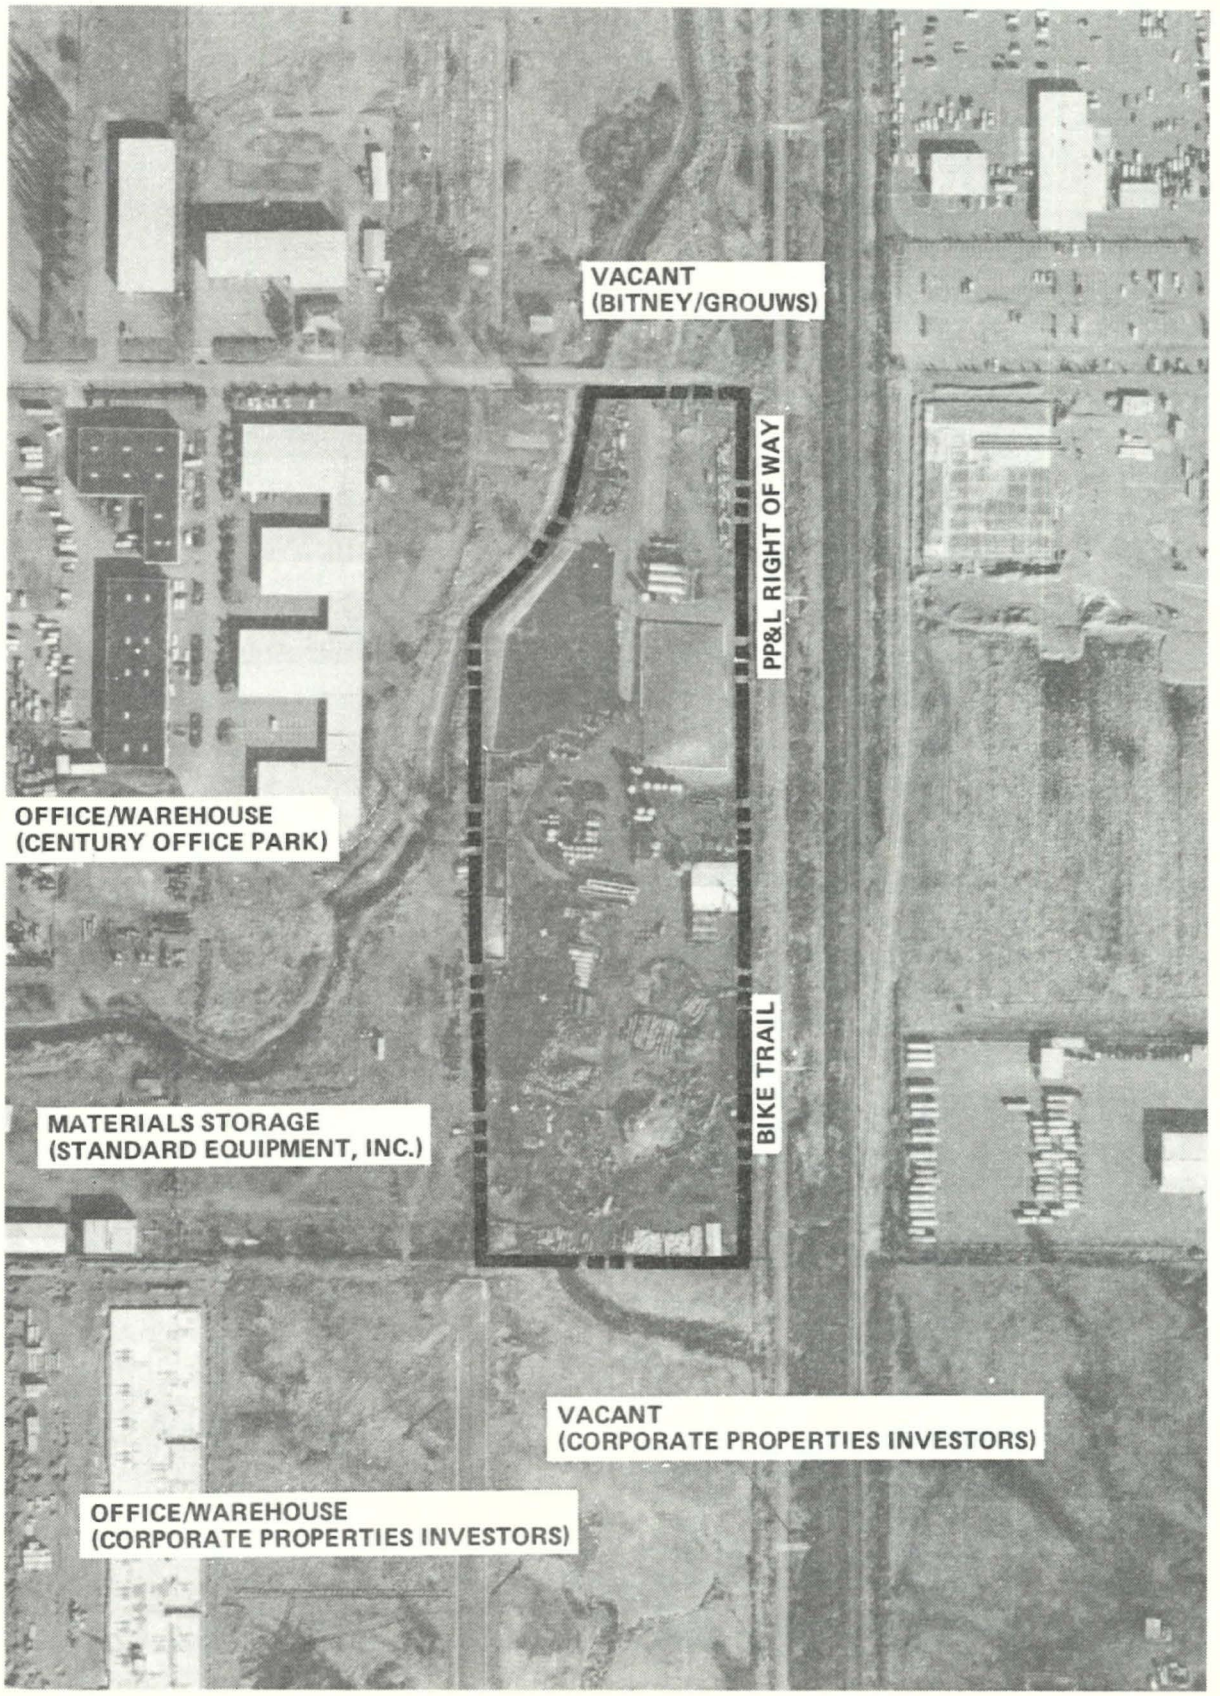

Figure 19
PROPERTY OWNERSHIP AND
EXISTING LAND USE

WESTERN PROCESSING
Kent, Washington

is determined. The property owners to the north (5 acres) and the west (16 acres) have recently developed plans for office and warehouse developments similar to others in the area. The property owners have been told that development of their property cannot occur until the extent of offsite contamination is determined. The property owners believe that it may be too costly to postpone development of their property but also too costly to undertake the remedial actions that might be necessary before they are able to develop their property.

There are no specific development plans for the property to the south of the site which is owned by Corporate Properties Investors. The owners intend to develop the property in the future with warehouses or other industrial uses, but at this time the specific development and timing of construction have not been determined.

If the current property owners are not able to realize their development plans, the uses that may be developed by future owners consistent with the zoning and comprehensive plan are listed in Table 8.

Adjacent property to the north, south, and west developed under existing regulations could consist of light industrial uses and business parks. To the east (beyond the bike path, railroad, and PSP&L right-of-way), more intensive industrial uses with less restrictive development standards could be developed.

The City of Kent has long-range plans for the property under its control adjacent to the site. The City's Comprehensive Transportation Plan includes eventual expansion of South 196th Street adjacent to the site to a major east and west arterial across the Kent Valley. The plans include widening the road to five lanes and constructing a viaduct across the bike trail and railroad tracks. The current 6-year transportation plan includes an environmental assessment and route location study for this project. If the City pursues the project, it would be constructed in approximately 10 years.

Seventy-second Avenue South was recently extended to the southern boundary of the project site. It dead ends there and resumes about 1/2 mile north of the site. As development occurs in the area, the City of Kent intends to extend this street and the utilities in it. At this time the alignment of the road has not been selected, but two considerations which will enter into the location decision are (1) a warehouse north of S 196th Street lies in the proposed path of the 72nd Avenue connection and will have to be removed or the road curved to avoid it and (2) the value of a narrow parcel of land adjacent to the western boundary of

the Western Processing will be decreased if it is used as a street right-of-way. In order to avoid these problems, the City has considered curving the street slightly to the east onto the Western Processing site. The City has no definite plans to extend 72nd Avenue and will only do so when increased development in the area requires it.

The interurban bike trail extends along the east boundary of the Western Processing site. This segment was recently paved, and there are no plans to improve it further.

APPENDIX A.

List of Drums Containing Materials Generated During the Western Processing Remedial Investigation

Appendix A

LIST OF DRUMS CONTAINING MATERIALS GENERATED DURING THE WESTERN PROCESSING REMEDIAL INVESTIGATION

May to June 1984

Sequential Drum Number	Drum Identification Number	Drum Contents
1	WP-MB-01-0 to 15	Drill cuttings and bailed water
2	WP-MB-01-15 to 30	Drill cuttings and bailed water
3	WP-MB-01-30 to 38-1/2	Drill cuttings and bailed water
4	WP-MB-01-38-1/2 to 49	Drill cuttings and bailed water
5	WP-MB-01-49 to 60	Drill cuttings and bailed water
6	WP-MB-01-60 to 70	Drill cuttings and bailed water
7	WP-MB-01-70 to 80	Drill cuttings and bailed water
8	WP-MB-01-80 to 89	Drill cuttings and bailed water
9	WP-MB-01-89 to 95	Drill cuttings and bailed water
10	WP-MB-01-95 to 100	Drill cuttings and bailed water
11	WP-MB-01-95 to 100	Drill cuttings and bailed water
12	WP-MB-02-0 to 19	Drill cuttings and bailed water
13	WP-MB-02-19 to 34	Drill cuttings and bailed water
14	WP-MB-02-34 to 41	Drill cuttings and bailed water
15	WP-MB-02-41 to 54	Drill cuttings and bailed water
16	WP-MB-02-54 to 60	Drill cuttings and bailed water
17	WP-MB-02-54 to 60	Drill cuttings and bailed water

18	WP-MB-02-54 to 60	Drill cuttings and bailed water
19	WP-MB-03-0 to 20	Drill cuttings and bailed water
20	WP-MB-01	Disposable clothing and gear
21	WP-MB-02	Disposable clothing and gear
22	WP-MB-01, 02	Disposable clothing and gear
23	WP-MB-03-20 to 30	Drill cuttings and bailed water
24	WP-MB-02, 03	Disposable clothing and gear
25	WP-MB-03-30 to 44	Drill cuttings and bailed water
26	WP-MB-03-44 to 60	Drill cuttings and bailed water
27	WP-MB-03-60 to 65	Drill cuttings and bailed water
28	WP-MB-03-65 to 72	Drill cuttings and bailed water
29	WP-MB-03-72 to 80	Drill cuttings and bailed water
30	WP-MB-03-80 to 85	Drill cuttings and bailed water
31	WP-MB-03-85 to 95	Drill cuttings and bailed water
32	WP-MB-03-95 to 100	Drill cuttings and bailed water
33	WP-SB-04-0 to 34	Auger cuttings
34	WP-SB-05-0 to 39	Auger cuttings
35	WP-SB-05-0 to 39	Auger cuttings
36	WP-SB-06-0 to 39	Auger cuttings
37	WP-SB-06-0 to 39	Auger cuttings
38	WP-IB-01-0 to 40	Auger cuttings
39	WP-IB-01-40 to 60	Auger cuttings
40	WP-IB-01-40 to 60	Auger cuttings
41	WP-SB-11-0 to 29	Auger cuttings
42	WP-SB-11-0 to 29	Auger cuttings
43	WP-SB-11-0 to 29	Auger cuttings
44	WP-IB-02-0 to 59	Auger cuttings

45	WP-IB-02-0 to 59	Auger cuttings
46	WP-IB-02-0 to 59	Auger cuttings
47	WP-IB-02, SB-11, SB-09	Sampling equipment and personnel decontamination water
48	WP-SB-09-0 to 20	Auger cuttings
49	WP-SB-09-20 to 34	Auger cuttings
50	WP-SB-09-20 to 24	Auger cuttings
51	WP-SB-12-0 to 24	Auger cuttings
52	WP-SB-12-24 to 29	Auger cuttings
53	WP-IB-02, SB-09	Drilling equipment decontamination water
54	WP-SB-09, SB-11	Drilling equipment decontamination water
55	WP-SB-11, SB-12	Drilling equipment decontamination water
56	WP-SB-07-0 to 34	Auger cuttings and ground cover
57	WP-SB-07-0 to 34	Auger cuttings
58	WP-SB-07-0 to 34	Auger cuttings
59	WP-SB-07, 08, 10, 12	Sampling equipment and personnel decontamination water
60	WP-SB-08-0 to 29	Auger cuttings
61	WP-SB-08-0 to 29	Auger cuttings
62	WP-SB-08-0 to 29	Auger cuttings
63	WP-IB-02, SB-07, 08, 09, 10, 11, 12	Disposable clothing and gear
64	WP-SB-12-24 to 29	Auger cuttings
65	WP-SB-08, 12	Drilling equipment decontamination water
66	WP-SB-07, 10	Drilling equipment decontamination water
67	WP-SB-07, 10	Disposable clothing and contaminated plastic ground cover

68	WP-SB-10-0 to 29	Auger cuttings
69	WP-SB-10-0 to 29	Auger cuttings
70	WP-SB-18	Drilling equipment decontamination water
71	WP-SB-13	Drilling equipment decontamination water
72	WP-SB-18-0 to 29	Auger cuttings
73	WP-SB-18-0 to 29	Auger cuttings
74	WP-SB-18	Contaminated plastic ground cover
75	WP-SB-13-0 to 29	Auger cuttings
76	WP-SB-13-29 to 34	Auger cuttings
77	WP-SB-13-29 to 34	Auger cuttings and contaminated plastic ground cover
78	WP-SB-13	Drilling equipment decontamination water
79	WP-SB-15-0 to 29	Auger cuttings
80	WP-SB-15-0 to 29	Auger cuttings
81	WP-SB-15-0 to 29	Auger cuttings and contaminated plastic ground cover
82	WP-SB-14-0 to 39	Auger cuttings
83	WP-SB-14-0 to 39	Auger cuttings
84	WP-SB-14-0 to 39	Auger cuttings
85	WP-SB-14-0 to 39	Auger cuttings
86	WP-SB-14	Drilling equipment decontamination water
87	WP-SB-16	Drilling equipment decontamination water
88	WP-SB-16-0 to 29	Auger cuttings
89	WP-SB-16-0 to 29	Auger cuttings and contaminated plastic ground cover
90	WP-SB-16-0 to 29	Auger cuttings
91	WP-SB-17	Drilling equipment decontamination water

92	WP-SB-17-0 to 34	Auger cuttings and contaminated plastic ground cover
93	WP-SB-17-0 to 34	Auger cuttings
94	WP-SB-17-0 to 34	Auger cuttings
95	WP-SB-13, 15, 16 17, 18	Disposable clothing and gear
96	WP-SB-17	Drilling equipment decontamination water
97	WP-SB-03-0 to 34	Auger cuttings
98	WP-SB-03-0 to 34	Auger cuttings
99	WP-SB-03-0 to 34	Auger cuttings
100	WP-SB-02-0 to 29	Auger cuttings
101	WP-SB-02-0 to 29	Auger cuttings
102	WP-SB-02-0 to 29	Auger cuttings
103	WP-SB-01-0 to 29	Auger cuttings
104	WP-SB-01-0 to 29	Auger cuttings
105	WP-SB-01-0 to 29	Auger cuttings
106	WP-SB-19-0 to 29	Auger cuttings
107	WP-SB-19-0 to 29	Auger cuttings
108	WP-SB-19-0 to 29	Auger cuttings
109	WP-SB-19-0 to 29	Auger cuttings
110	WP-SB-20	Drilling equipment decontamination water
111	WP-SB-20	Drilling equipment decontamination water
112	WP-SB-20-0 to 29	Auger cuttings
113	WP-SB-20-0 to 29	Auger cuttings
114	WP-IB-03-0 to 59	Auger cuttings
115	WP-IB-03-0 to 59	Auger cuttings
116	WP-IB-03-0 to 59	Auger cuttings

117	WP-IB-03-0 to 59	Auger cuttings
118	WP-IB-03-0 to 59	Auger cuttings
119	WP-MB-01	Development water
120	WP-MB-01	Development water
121	WP-MB-01	Development water
122	WP-MB-02	Development water
123	WP-MB-02	Development water
124	WP-MB-02	Development water
125	WP-MB-03	Development water
126	WP-MB-03	Development water
127	WP-MB-03	Development water
128	WP-MB-03	Development water
129	WP-MB-03	Development water
130	WP-MB-03	Development water
131	WP-MB-03	Development water
132	WP-MB-03	Development water
133	WP-MB-03	Development water
134	WP-SB-13, 14, 15, 16, 17, 18	Disposable clothing and contaminated plastic ground covers
135	WP-MB-03	Disposable clothing and gear
136	WP-MB-03	Disposable clothing and gear
137	WP-MB-03	Disposable clothing and gear
138	WP-MB-03	Disposable clothing and gear
139	WP-MB-01	Purge water
140	WP-MB-01	Purge water
141	WP-MB-01	Purge water
142	WP-MB-02	Purge water

143	WP-MB-02	Purge water
144	WP-CSL-Holding tank	Lab glassware wash water
145	WP-CSL-Holding tank	Lab glassware wash water
146	WP-CSL-Holding tank	Lab glassware wash water
147	WP-SB-15	Equipment decon water
148	WP-MI-Disp.	Disposable clothing and gear
149	WP-PB-05-0 to 18	Drill cuttings and bailed water
150	WP-MI-Disp.	Disposable clothing and gear mixed with water
151	WP-MI-Disp.	Disposable cloghting and gear mixed with water
152	WP-MI-Disp.	Disposable clothing and gear mixed with water
153	WP-MW-35	Purge Water
154	WP-MW-35	Purge Water
155	WP-MW-35	Purge Water
156	WP-MW-34	Purge Water
157	WP-MW-34	Purge Water
158	WP-MW-34	Purge Water
159	WP-MI-Disp.	Disposable clothing and gear
160	WP-MI-Disp.	Decontamination water
161	WP-MI-Disp.	Disposable clothing and gear
162	WP-MI-Disp.	Disposable clothing and gear
163	WP-MI-Disp.	Disposable clothing and gear
164	WP-MI-Disp.	Disposable clothing and gear
165	WP-MI-Disp.	Decontamination water
166	WP-MI-Disp.	Disposable clothing and gear

In addition to the above-listed drum, there are two drums 5-1 and 5-2, generated by the JRB Company currently being stored on the site. These drums are not for disposal. Each drum is clearly marked and will be shipped to the address listed below in the summer of 1984.

APPENDIX B.

Boring Logs for Monitoring Borings, Intermediate Borings, Shallow Borings, Deep Borings

Depth Below Surface (ft)	
	MB-01 (5/8/84-5/11/84)
0-15	Brown silty SAND, sand fine, loose
15-20	Brown silty SAND, sand fine, slightly cohesive
20-30	Blackish-brown SAND with interlayered silt and clay, sand fine to medium
30-55	Dark gray silty SAND, sand fine to medium
55-75	Dark gray SAND with trace silt, sand fine to medium
75-90	Gray SAND, fine to medium
90-100	Gray silty SAND, sand fine to medium
	MB-02 (5/14/84-5/15/84)
0-15	Gray-brown clayey sandy SILT, sand fine
15-35	Brown silty SAND, sand fine
35-45	Gray silty SAND, sand fine to medium
45-60	Gray SAND with trace silt, sand medium, occasional wood fragments
	MB-03 (5/17/84-5/18/84)
0-5	Brown sandy SILT with some angular gravel (up to 3/4 inch), sand fine to medium, soil stained near surface
5-15	Grayish-brown clayey SILT with black cinders
15-25	Grayish-brown clayey SILT with some fine sand
25-40	Gray silty SAND, sand fine to medium, some wood fragments
40-55	Gray medium SAND with some wood fragments
55-70	Gray silty SAND, sand medium
70-80	Gray silty SAND, sand fine to medium

Depth Below Surface (ft)	
80-100	Gray silty SAND, sand fine to medium, with varying amounts of wood fragments
	IB-01 (5/23/84)
0-4	Gray-brown SILT with some sand near surface, mottled due to iron staining, abundant organic material
4-9	Gray clayey SILT with some iron-stained mottling
9-14	Gray fine to medium SAND interlayered with sandy silt layers
14-19	Gray SILT with some fine sand, abundant wood fragments
19-24	Gray silty fine SAND with abundant wood fragments
24-29	Gray fine sandy SILT with abundant wood fragments
29-34	Gray clayey SILT with abundant wood fragments
34-39	Gray silty SAND, sand fine to medium, interlayered fine sandy silt zone
39-64	Black fine SAND
	IB-02 (5/24/84)
0-4	Brown silty SAND, gravelly near surface, sand fine to medium
4-9	Gray silty SAND to 8 feet, gray silty CLAY to 9 feet
9-14	Brownish-gray SILT, slightly cohesive
14-19	Bluish-gray silty CLAY, one-inch layer of organic material
19-24	Gray SILT, 1/2-inch layer of organic material, slightly cohesive
24-29	Interlayered gray silty fine SAND and gray clayey SILT, cohesive in clayey zones

Depth Below Surface (ft)	
29-34	Black fine SAND, 2-inch layer of dark gray SILT at 34 feet
34-44	Interlayered gray fine SAND and gray cohesive SILT, silt layers approximately one inch thick
44-49	Gray SILT, 2-inch layer of black fine SAND
49-59	Dark gray fine to medium SAND

IB-03 (6/7/84)

0-4	Grayish-brown silty gravelly SAND with abundant organic material grading through a brown sandy SILT to a gray SILT with some CLAY, sand fine
4-9	Grayish-brown sandy SILT, sand fine, slightly cohesive
9-24	Gray fine to medium SAND with some silt
24-29	Gray silty SAND, sand fine to medium
29-34	Gray fine to medium SAND with some silt
34-39	Gray silty medium SAND grading to a clayey SILT, strongly cohesive in lower part
39-44	Gray clayey SILT with some fine SAND, moderately cohesive
44-49	Gray clayey SILT with abundant wood fragments, abrupt change at 48 feet to gray medium SAND with some silt
49-54	Gray silty SAND, sand finer at top, becoming gradually coarser towards bottom, some wood fragments
54-59	Gray medium SAND with trace silt

SB-01 (6/5/84)

0-4	Brown sandy SILT with some gravel
4-14	Gray sandy SILT with reddish-brown mottling, sand fine

Depth Below Surface (ft)	
14-19	Gray sandy SILT, sand fine to medium
19-29	Gray sandy SILT, sand fine
	SB-02 (6/4/84)
0-4	Grayish-brown sandy SILT, sand fine to medium, some gravel, abundant organic material
4-9	Gray SILT, brown mottling, some fine sand, occasional wood fragments
9-14	Gray sandy SILT with some clay, sand medium, slightly cohesive
14-24	Gray sandy clayey SILT, sand fine, strongly cohesive, occasional layers of bluish organic material
24-29	Gray sandy SILT with some clay, sand fine to medium
	SB-03 (6/4/84)
0-4	Brown sandy, gravelly SILT, sand fine to medium
4-9	Brownish-gray silty SAND, sand medium
9-14	Gray clayey SILT, strongly cohesive
14-24	Gray sandy SILT, sand fine
24-34	Gray sandy SILT, sand fine to medium, some wood fragments
	SB-04 (5/21/84)
0-4	Brown clayey SILT with gray streaks, some woody fragments
4-9	Gray sandy SILT, sand fine
9-14	Gray clayey SILT with some fine sand
14-24	Gray silty SAND, sand fine to medium
24-30	Gray SILT with some clay
30-33	Gray silty SAND, sand fine to medium
33-34	Gray clayey SILT, little sand

Depth Below Surface (ft)	
	SB-05 (5/21/84)
0-4	Brown sandy SILT, sand medium
4-9	Light brown clayey SILT, some localized iron staining
9-14	Gray clayey SILT
14-19	Interbedded gray silty SAND and brownish-gray clayey SILT, abundant wood fragments
19-29	Black SAND, little silt
29-34	Dark grayish-brown SILT, with trace fine sand, large wood fragments
34-39	Dark grayish-brown SILT with some fine sand
	SB-06 (5/22/84)
0-4	Brown clayey SILT with some fine sand, localized iron staining, abundant organic matter
4-9	Blue-gray SILT with some clay, some wood fragments
9-14	Dark gray clayey SILT with some fine sand
14-24	Dark gray silty SAND, sand fine to medium, interlayered with sandy silt, wood fragments present
24-34	Gray SILT with some fine sand, tight, wood fragments common
	SB-07 (5/30/84)
0-4	Brownish-gray clayey SILT grading to a gray medium SAND with trace silt
4-9	Gray silty medium SAND grading to a gray clayey SILT with trace fine sand, moderately cohesive
9-14	Gray silty SAND, sand fine to medium
14-19	Gray sandy SILT, sand fine, abrupt change to a cohesive clayey silt

Depth Below Surface (ft)	
19-24	Gray sandy SILT, sand fine
24-29	Gray clayey SILT, with a sandy silt zone, sand fine
29-34	Gray silty SAND, sand fine

SB-08 (5/29/84)

0-4	Grayish-brown silty SAND with some gravel in upper part, sand fine to medium, gravel up to one inch
4-9	Gray silty medium SAND grading to a fine sandy gray SILT
9-29	Gray SAND with trace silt, sand fine to medium, primarily medium

SB-09 (5/25/84)

0-4	Brownish-gray gravelly SILT, some iron staining, cohesive, abrupt change at 3-1/2 feet to black fine SAND with some silt
4-14	Gray to grayish-brown SILT with some fine sand, occasional wood fragments, slightly cohesive
14-19	Grayish-brown silty CLAY, strongly cohesive
19-24	Buff silty CLAY, moderately cohesive
24-33	Dark gray silty SAND, sand fine
33-34	Gray silty CLAY, large wood fragments, moderately cohesive

SB-10 (5/25/84)

0-4	Reddish-brown medium SAND with trace silt, some gravel near surface
4-9	Gray clayey SILT with some fine sand, slightly cohesive
9-14	Gray silty SAND, sand fine to medium, occasional wood fragments, dry
14-19	Greenish-gray clayey SILT with intrabedded sandy zone

Depth Below Surface (ft)	
19-24	Gray sandy SILT, sand fine, small wood fragments, moderately cohesive
24-29	Gradual gradation from a gray fine to medium silty SAND through a moderately cohesive sandy SILT to a brownish black, strongly cohesive clayey SILT, very dry at bottom
	SB-11 (5/25/84)
0-4	Brownish-gray silty SAND, sand fine, occasional gravel near surface
4-9	Gray silty CLAY with mottled appearance from iron staining, cohesive, 2-inch layer of dark gray silt
9-14	Dark gray silty fine SAND
14-19	Dark brownish-gray silty CLAY, 2-inch layer of black fine SILT at bottom
19-24	Grayish-black silty SAND, sand fine, occasional wood fragments, 2-inch layer of brownish-gray cohesive silty CLAY at top
24-29	Dark gray SILT, soft
	SB-12 (5/29/84)
0-4	Gray sandy SILT, sand fine, moderately cohesive
4-9	Interlayered gray fine sandy SILT and silty medium SAND, some wood fragments
9-29	Gray SAND with some silt, sand fine to medium, primarily medium, occasional wood fragments
	SB-13 (5/31/84)
0-4	Brown clayey sandy SILT with some gravel, sand fine, some broken concrete
4-14	Gray silty SAND, sand fine to medium, primarily medium near 14 feet, occasional wood fragments
14-34	Gray medium SAND with some silt, large wood fragments at 19 and 24 feet

Depth Below Surface (ft)	
	SB-14 (6/1/84)
0-4	Brownish-black sandy SILT at surface grading through a reddish-brown medium SAND to a gray sandy SILT, sand fine
4-14	Gray silty SAND, sand medium to fine
14-19	Gray SAND with some silt, sand medium to fine
19-24	Gray SAND with trace silt, sand medium to coarse
24-29	Gray medium SAND with some 1/4-inch rounded gravel, thin brown silty SAND layer near 28 feet
29-39	Gray silty SAND with abundant wood fragments, sand fine to medium
	SB-15 (6/1/84)
0-4	Grayish-brown gravelly sandy SILT, sand medium
4-9	Grayish-brown sandy SILT, sand fine to medium, moderately cohesive
9-29	Gray fine to medium SAND with trace silt. Abrupt transition at 28 feet to a brown silt with some clay, occasional wood fragments
	SB-16 (6/2/84)
0-4	Grayish-brown sandy SILT with some gravel grading to a medium SAND with some silt
4-9	Brown silty SAND, sand medium
9-14	Gray sandy SILT, sand fine
14-19	Brownish-gray silty SAND, sand medium, large wood fragments
19-24	Gray silty SAND, sand fine to medium, large piece of wood from 22 feet to 24 feet
24-29	Gray medium SAND with some silt, abundant wood chips

Depth Below Surface (ft)	
	SB-17 (6/2/84)
0-4	Brownish-gray silty SAND, gravelly near surface, sand fine to medium
4-9	Brown silty fine to medium SAND
9-14	Gray sandy SILT, sand fine, slightly cohesive
14-19	One- to 2-inch interlayered sandy SILT and silty SAND, sand fine to medium
19-24	Gray clayey SILT grading to a brownish-gray silty SAND, sand fine to medium
24-29	Gray silty fine SAND, abrupt change at 28 feet to gray fine sandy SILT
29-34	Gray medium SAND with some silt
	SB-18 5/31/84)
0-4	Brown clayey SILT with some fine sand, gravelly near surface, thin gray silt layer at 3 feet
4-14	Grayish-brown SAND with some silt, sand fine to medium
14-19	Gray SILT grading to a medium sandy SILT, occasional clayey zones
19-24	Gray medium SAND with some silt
24-29	Gray interlayered sandy SILT and silty SAND, sand fine, abundant wood fragments, sulfide odor
	SB-19 (6/5/84)
0-4	Brown sandy SILT, some wood fragments
4-9	Gray silty SAND with orange mottling, one-inch interlayered reddish-orange sandy SILT, some wood fragments

Depth Below Surface (ft)	
9-14	Dark gray sandy SILT
14-19	Interlayered brown sandy SILT and gray silty SAND, occasional wood fragments
19-24	Dark gray medium SAND
24-34	Gray sand SILT with some wood fragments
34-39	Dark gray silty SAND
39-46	Dark gray SAND with some silt
	SB-20 (6/6/84)
0-4	Brown fine to medium SAND with abundant wood fragments, shallow silty zone near surface
4-9	Gray sandy SILT grading through a brown SAND with some silt to a gray SAND with some silt, brown mottling in silty zones
9-14	Gray silty SAND, sand fine
14-19	Gray SILT with black wood fibers
19-24	Gray sandy SILT, moderately cohesive
24-29	Gray silty SAND, sand fine to medium, one-inch layer of sandy SILT
	DB-01 (5/24/84-6/1/84)
0-10	Gray sandy SILT, sand fine
10-20	Gray silty SAND, sand fine to medium
20-50	Gray clayey SILT with woody fragments, cohesive
50-69	Gray silty SAND, sand medium, weakly cemented
69-78	Dark gray slightly silty SAND, sand medium
78-90	Dark gray clayey SILT with some fine sand, cohesive
90-103	Dark gray sandy SILT, sand fine
103-106	Dark gray slightly clayey sandy SILT, sand fine

Depth Below Surface (ft)	
106-137	Dark gray SAND with some silt, sand fine to medium, some woody fragments
137-147	Gray silty SAND with some clay, sand fine to medium
147-325	Dark gray SILT with intermittent clayey zones, some sand fine to medium, primarily medium, loose to slightly cohesive
325-365	Gray clayey silt with occasional trace of fine sand, cohesive

APPENDIX D.

CH2M HILL Close-Support Laboratory Analytical Methodology

SCREENING ANALYSIS OF SOILS FOR ORGANIC CONSTITUENTS

1. Application: This is a gas chromatographic method applicable to screening analysis for organic constituents in soil samples at the Western Processing site. The method is based on EPA Test Methods 8010 (Halogenated Volatile Organics) and 3550 (Sonication Extraction).

2. Target Compounds: Methylene Chloride, CH_2Cl_2
Trichlorethylene, C_2HCl_3
Tetrachloroethylene, C_2Cl_4

3. Summary of Method: A measured quantity of soil, approximately 25 gms, is weighed out in a VOA vial and solvent extracted with 10 ml or less of a suitable solvent (pentane, iso octane, hexane, etc.). The soil and solvent are sonically mixed and extracted in a high wattage ultrasound cup. The solvent extract layer is recovered and an aliquot injected into the GC column. GC configuration and operating conditions are described herein which permit the separation and measurement of the target compounds in the extract using flame ionization detection (FID). Minimum detection limit is expected to be 0.2 ppm (micrograms per gram) for the target compounds in the soil samples.

4. Materials and Reagents.

4.1 A Hewlett-Packard model 5880A dual column, dual flame ionization gas chromotograph (G.C.) with electronic integrator.

4.2 G.C. columns; 10 percent SP 2100, 100/120 Supelcoport 10-foot x 1/8-inch stainless steel or equivalent.

4.3 Flame ionization detectors.

4.4 Syringes, as required for injection of sample extracts.

4.5 Glassware, volumetric as required for preparation of standards and sample analysis.

4.6 Ultrasound sonification unit; Heat Systems Ultra-Sonics, Inc., Model W-375 ultrasound generator with cup probe.

4.7 Balances, top loading and analytical as needed for preparation of standards and sample analysis.

4.8 Solvents; pentane, hexane, isoctane, etc. spectrograde as required for extraction of samples.

4.9 Support gases: nitrogen, hydrogen and zero air complete with regulators, chemical traps and fittings for connection to G.C.

5. Calibration

5.1 Establish G.C. operating condition to produce resolution of target compounds.

5.2 External calibration with a minimum of three concentration levels for each constituent. One of the standards shall be near the method detection limit (MDL).

5.3 Working calibration shall be verified on each working day by measurement of one or more calibration standard. If the response varies by more than ± 10 percent, the test shall be repeated with fresh calibration standard or new calibration shall be performed using freshly prepared standards.

6. Quality Assurance

6.1 The analyses described herein are intended as screening analyses for the target compounds. Quality assurance checks such as method validation, performance, and precision and accuracy will be performed in the CH2M HILL laboratories prior to use in field screening of samples.

7. Calculations

The concentration of target compounds in the soil samples is calculated as follows:

$$\text{Conc. } \mu g/gm = \frac{(A)\ (Vt)}{(Vi)\ (Ws)}$$

where: A = amount of target compound found (ng)
Vi = volume of extract injected (ul)
Vt = volume of total extract (ml)
Ws = weight of sample (gm)

SCREENING ANALYSIS OF SOIL FOR PHENOL AND BIS (2-ETHYL HEXYL) PHTHALATE

1. Application: This is a gas chromatographic method applicable to screening analysis of soil samples for phenol and bis (2-ethyl hexyl) phthalate from the Western Processing site. The method is based on EPA Test Methods 8040 (phenols) and 8060 (phthalate esters).

2. Target Compounds: Phenol
Bis (2-ethyl hexyl) phthalate

3. Summary of Method:

3.1 A measured quantity of soil, approximately 25 gms, is weighed out in VOA vial or suitable container and enough deionized water, roughly 5-10 ml, is added to slurry the soil.

3.2 Bis (2-ethyl hexyl) phthalate extraction step: the pH of the slurry is measured and, if required, adjusted to between pH 7.0 and 7.5 with dilute NaOH or H_2SO_4. 10 ml of methylene chloride is added, the soil-slurry and solvent are sonically mixed and extracted in a high wattage ultra sound cup. A 1.0-ml portion of the methylene chloride extract is recovered.

3.3 Phenol extraction step: Using the previously extracted sample, 1.0 ml of methylene chloride is added to make up the original 10-ml solvent volume. Adjust the pH of the soil-slurry equal to or less than 2.0 with H_2SO_4, mix and sonically extract as previously discussed. A 1.0-ml portion of the methylene chloride extract is recovered.

3.4 Extract analysis: The 1.0-ml volumes of the extracts are combined and a suitable aliquot injected into the G.C. column. The G.C. configuration and operating conditions described herein permit the separation and measurement of phenol and bis (2-ethyl hexyl) phthalate using flame ionization detection (FID). Minimum detection limit is expected to be 0.1 ppm (micrograms per gram) for the target compounds in the soil samples.

4. Materials and Reagents:

4.1 A Hewlett-Packard model 5880A dual column, dual flame ionization, gas chromatograph with electronic integrator.

4.2 G.C. columns: 1 percent SP 1240 DA, 80/100 Supelcoport 10 foot x 1/8-inch stainless steel (for phenol) and 10 percent SP 2100, 100/120 Supelcoport 10 foot x 1/8-inch stainless steel (for phthalate).

4.3 Flame ionization detector.

4.4 Syringes, as required for injection of sample extracts.

4.5 Glassware, volumetric, as required for preparation of standards and sample analysis.

4.6 Ultra sound sonification unit; Heat Systems Ultra-Sonics, Inc., model W-375 ultra sound generator with cup probe.

4.7 Balances, top loading and analytical as needed for preparation of standards and sample analysis.

4.8 Support gases; nitrogen, hydrogen, and zero air complete with regulators, chemical traps, and fittings for connection to G.C.

4.9 Methylene chloride, spectrophotometry grade

4.10 Deionized water

4.11 Sodium hydroxide, reagent grade, dilute as required

4.12 Sulfuric acid, regent grade, dilute as required

5. Calibration:

5.1 Establish G.C. operating conditions to produce resolution of phenol and bis (2-ethyl hexyl) phthalate.

5.2 External calibration with minimum of three concentration levels for each compound. One of the standards shall be near the method detection limit (MDL).

5.3 Working calibration shall be verified on each working day by measurement of one or more calibration standards. If the response varies by more than ±10 percent, the test shall be repeated with fresh calibration standard or new calibration shall be performed using freshly prepared standards.

6. Quality Assurance: The analyses described herein are intended as screen analyses for the target compounds. Quality assurance checks such as method validation, performance, and precision and accuracy will be performed in the CH2M HILL laboratories prior to use in field screening of samples.

7. Calculations: The concentration of target compounds in the soil samples is calculated as follows:

$$\text{Conc. } \mu g/gm \quad \frac{2(A)\ (Vt)}{(Vi)\ (Ws)}$$

Where: A = Amount of target compound found (ng)
Vi = Volume of extract injected (ul)
Vt = Volume of total extract (ml)
Ws = Weight of sample (gms)
2 = Dilution factor due to combining of extracts

SCREENING ANALYSIS OF SOIL SAMPLES FOR METALS

1. Application

This is an atomic absorption (A.A.) method applicable to screening analysis of soil samples for metallic elements from the Western Processing Site. The method is based on EPA Test Methods 3010 (Acid Digestion Procedure for Flame Atomic Absorption Spectroscopy), 7190 (Chromium), 7520 (Nickel), 7950 (Zinc), 7420 (Lead), and 7130 (Cadmium).

2. Target Elements:

Nickel, Ni
Zinc, Zn
Chromium, Cr
Lead, Pb
Cadmium, Cd

3. Summary of Method

A measured quantity of soil, approximately 5 gm, is weighed out in a griffin beaker with a watch glass cover. The samples are digested by treatment with 10 ml of 1+1 nitric acid, autoclaved for 45 minutes at 15 psig (251°F), and cooled. Add 5 ml of 30 percent hydrogen peroxide and 10 ml of 1+1 hydrochloric acid. The sample is heated on a hot plate until nitric acid fumes have dissipated and the sample is completely digested. The sample is cooled to room temperature, transferred to 100 ml volumetric flask, diluted to the mark with deionized water, and transferred to a suitable container. The sediments (if present) are allowed to settle. The metal elements are analyzed by direct flame aspiration into the A.A. Sample digestate is diluted as required such that the analysis is within the normal linear range of the element. The A.A. operating conditions described herein permit measurement of the target elements. Minimum detection limit is expected to be 1.0 ppm (microgram per gram) for the target elements.

4. Materials and Reagents

4.1 Atomic absorption system. Perkin-Elmer model 303 with strip chart recorder.

4.2 Hallow cathode tube lamps for Ni, Zn, and Cr.

4.3 Volumetric glassware as required for preparation of standards and sample analysis.

4.4 Griffin beakers, 250-ml tall form with 100-mm watch glass for sample digestions.

4.5 Hot plate; variable temperature control.

4.6 Autoclave

4.7 Nitric acid; reagent grade, redistilled.

4.8 Hydrochloric acid; reagent grade.

4.9 Hydrogen peroxide, 30 percent.

4.10 Standards, stock solutions; 1000 ppm Ni, Zn and Cr.

5. Calibration

5.1 Establish A.A. operating conditions including nebulizer, lamp, burner head, flame, and analytical wave length so as to optimize absorbence for each target element.

5.2 Develop calibration curve for each element with a minimum of three concentration levels within the normal linear range for that element. One of the standards shall be near the method detection limit (MDL).

5.3 Working calibration shall be verified each time a lamp for an element is inserted or at the start of each working day. Mid-range standards will be analyzed along with every lot of 10 samples. If response varies by more than ± 10 percent the test shall be repeated with fresh calibration standard or a new calibration shall be performed using freshly prepared standards.

6. Quality Assurance

The measurements described herein are intended as screening analyses for the target elements in soil. Quality assurance checks such as method validation, performance, and precision and accuracy will be performed in the CH2M HILL laboratories prior to use in field screening of samples.

7. Calculations

The concentration of target elements in the soil samples is calculated as follows:

$$\text{Conc. } \mu g/gm = \frac{(A)\ (Vt)}{Ws}$$

where: A = amount of target element found (µg/ml)
Vt = final volume of digestate (ml)
Ws = weight of sample (gm)

APPENDIX F.

Summary of Contract Laboratory Program Inorganics Data; Soil and Groundwater Samples and Transport Blanks

ORGANIC/INORGANIC DESCRIPTOR DEFINITIONS

U = Undetected at given detection limit

C = Concentration corrected for blank

M = K = Not quantified but concentration is between the stated detection limit and five times the detection limit

ND = No data currently available. Sample was not submitted to the CLP for analysis

ND = NT = Sample submitted to the CLP but no test data was received. Sample assumed not tested

NA = Sample not analyzed. Sample not submitted to the CLP for analysis

J = Estimated concentration

ND/B = UB = Not detected due to contamination in laboratory blank. Concentration corrected for blank error to indicate nondetection.

NOTE: 1. GW-01, 02, AND 03 WERE COLLECTED FROM ONSITE MONITORING WELLS MW-01, 02, AND 03 RESPECTIVELY. GW-03 WAS COLLECTED FROM THE 68 FOOT DEPTH PORTAL OF THE WEST BAY MULTIPLE PORT SAMPLER IN MW-03. MW-01 IS A 4-INCH WELL SCREENED AT 75 TO 95 FEET. MW-02 IS A 4-INCH WELL ADJACENT TO MW-01 AND SCREENED AT 35 TO 55 FEET.

2. MW-34 AND 35 ARE OFFSITE WELLS INSTALLED IN JUNE, 1983. MW-34 IS A CLUSTER WELL CONSISTING OF 34A AND 34B. MW-34A IS A 2-INCH WELL SCREENED AT 52 TO 62 FEET. MW-34B IS A 4-INCH WELL SCREENED AT 124 TO 134 FEET. MW-35 IS A 4-INCH WELL SCREENED AT 55 TO 75 FEET.

NOTE: 1. GW-01, 02, AND 03 WERE COLLECTED FROM ONSITE MONITORING WELLS MW-01, 02, AND 03 RESPECTIVELY. GW-03 WAS COLLECTED FROM THE 68 FOOT DEPTH PORTAL OF THE WEST BAY MULTIPLE PORT SAMPLER IN MW-03. MW-01 IS A 4-INCH WELL SCREENED AT 75 TO 95 FEET. MW-02 IS A 4-INCH WELL ADJACENT TO MW-01 AND SCREENED AT 35 TO 55 FEET.

2. MW-34 AND 35 ARE OFFSITE WELLS INSTALLED IN JUNE, 1983. MW-34 IS A CLUSTER WELL CONSISTING OF 34A AND 34B. MW-34A IS A 2-INCH WELL SCREENED AT 52 TO 62 FEET. MW-34B IS A 4-INCH WELL

UPDATE 12-Dec-84

APPENDIX G

Summary of Contract Laboratory Program (CLP) Organics Data; Soil and Groundwater Samples and Transport Blanks

ORGANIC/INORGANIC DESCRIPTOR DEFINITIONS

U = Undetected at given detection limit

C = Concentration corrected for blank

M = K = Not quantified but concentration is between the stated detection limit and five times the detection limit

ND = No data currently available. Sample was not submitted to the CLP for analysis

ND = NT = Sample submitted to the CLP but no test data was received. Sample assumed not tested

NA = Sample not analyzed. Sample not submitted to the CLP for analysis

J = Estimated concentration

ND/B = UB = Not detected due to contamination in laboratory blank. Concentration corrected for blank error to indicate nondetection.

NOTE: 1. GW-01, 02, AND 03 WERE COLLECTED FROM ONSITE MONITORING WELLS MB-01, 02, AND 03 RESPECTIVELY. GW-03 WAS COLLECTED FROM THE 68 FOOT DEPTH PORTAL OF THE WEST BAY MULTIPLE PORT SAMPLER IN MB-03. MB-01 IS A 4-INCH WELL SCREENED AT 75 TO 95 FEET. MB-02 IS A 4-INCH WELL ADJACENT TO MB-01 AND SCREENED AT 35 TO 55 FEET.

2. MW-34 AND 35 ARE OFFSITE WELLS INSTALLED IN JUNE, 1983. MW-34 IS A CLUSTER WELL CONSISTING OF 34A AND 34B. MW-34A IS A 2-INCH WELL SCREENED AT 52 TO 62 FEET. MW-34BIS A 4-INCH WELL SCREENED AT 124 TO 134 FEET. MW-35 IS A 4-INCH WELL SCREENED AT 55 TO 75 FEET.

APPENDIX L.

U.S. Environmental Protection Agency
Report of Western Processing Vicinity
May 1982 Survey

administratively reviewed within EPA and is for internal Agency use/ distribution only."

July 22, 1982

WESTERN PROCESSING VICINITY SURVEY
(Intensive Field Study of May 20-21, 1982)

INTRODUCTION

Western Processing Co., Inc. (7215 South 196th, Kent, Washington) has been in operation since 1957, initially as an animal by-product/brewer's yeast reprocessor and more recently as a recycler & reclaimer of a broad spectrum of industrial waste materials.

Inspections by Washington Department of Ecology, Seattle Metro, and EPA, going back to 1979, have shown potential operational problems with the site which may be resulting in introduction of waste materials to surface waters by direct runoff and/or by seepage to ground and then discharge to Mill Creek (commonly referred to as County Drain #1) via springs along the Western Processing Company's west boundary and/or immediately downstream from the processing site.

Recent surface water samples collected near the site by both DOE and Metro show elevated heavy metals and specific conductance levels, apparently from contaminants seeping from the site.

The purpose of EPA's field study was to collect surface water, ground water, and sediment samples both upstream (upgradient) and downstream (downgradient) from the site in order to verify other agency findings and to determine if off site influences from this facility were readily documentable in the form of elevated priority pollutant levels.

Figure 1 shows the local drainage as it existed at the time of the survey. Mill Creek, flowing at approximately 3 cfs, was quite turbid at all stations sampled. The east drain, which drains an area to the south and, east, was septic and had an estimated flow of 0.1 cfs. The east ditch was dry on May 20-21. This ditch receives storm runoff from a limited area along the east property line of Western Processing and possibly receives process waste discharge on occasion (hoses were noted drapped across the fence and personal communication between citizens using the jogging path and EPA investigators indicates that discharges from these hoses have been observed in the past). A low area or depression located north of S. 196th, which would receive flow from the east ditch, was dry. The east ditch contained some water in October, 1981, (personnel communication from Jack Sceva). Water entering the depression would either evaporate, spill over into Mill Creek, or perculate to Mill Creek through the soil zone. Figures 2A, 2B, and 2C show the site plan and cross section information for the vicinity of Western Processing.

SAMPLING PROGRAM

The sample stations shown on Figure 3 were selected in an attempt to determine existing conditions upstream, adjacent to and downstream from the Western Processing site. Sediment samples were obtained

(not to scale)

on all four sides of the property to characterize past or present drainage influences. Surface water samples were taken from standing water to the south as well as from several points in Mill Creek and the east drainage. And finally, well point samples were taken upstream, adjacent to the property, immediately downstream as well as downstream from the intermittant spring area referred to in the introduction. The well point samples were intended to measure possible contamination of the interstitial ground water directly below the stream bed.

Station locations and types of samples collected at each station are as follows:

Station Locations & Sample Type

Station 1 - Upstream edge of bike path bridge - Mill Creek. (Surface water sample and sediment sample).

Station 2 - East drain, 20 ft. upstream from mouth. (Surface water and sediment samples)

Station 3(A&B) - Mill Creek north of 196th St. and immediately downstream from intermittent pond spring/overflow point. (Surface water, well point & sediment samples).

Station 4 - Dry Pond area north of east ditch - north edge. Approximately 20 ft. south of second power pole N of 196th. (Sediment sample).

Station 5 - Dry pond area north of east ditch - south edge approximately 15 ft. S. of property corner W of bike path and N. of 196th. (sediment sample).

Station 6(A) - Mill Creek - upstream edge of 196th St. bridge. (Surface water and sediment sample).

Station 6(B) - Mill Creek - downstream edge of 196th St. bridge. (Well point sample).

Station 7(A&B) - Mill Creek, ≈ 40 ft. downstream from foot bridge. (Surface water, sediment and well point samples).

Station 8(A&B) - Mill Creek, ≈40 ft. downstream from highway 181 bridge. (Surface water, sediment & well point samples).

Station 9 - East ditch, ≈270 ft. north of Western Processing S. property line. (Sediment).

Station 10 - "Stagnant" pond located south of Western Processing. Samples collected ≈ 120 ft. E. of access road running N-S. (Surface water and sediment samples).

Station 11 - East drain at point it crosses RR ≈215 ft. N. of Western Processing - south property line. (Surface water and sediment sample).

SAMPLING METHODS

Surface water samples were collected by dipping the sample container into the stream. The sampler wore hip boots and rubber gloves to avoid contamination from the sampled media. Samples were taken from mid stream, immediately below the water surface. The following quantities were collected at each station:

(a) 1 gallon for extractable analysis (glass jar with teflon liner),

(b) 1/2 gal. for phenols (glass jar with teflon liner),

(c) 1/2 gal. for herbicides (glass jar with teflon liner),

(d) 1 quart cubitainer for metals,

(e) 1 quart cubitainer for cyanides, and

(f) 2 each - 20 ml. VOA containers for volatiles.

Well point samples were collected by driving a K-V Associates Model 12 well point sampler to a depth of five feet below the stream bed and pumping from the well point with a vacuum pump (part of the model 12 equipment). One quart of pumped water was wasted prior to sample collection. The same series of samples as for surface water was collected.

Sediment samples were collected using a clean garden shovel and placed in either 1 quart or 1/2 gallon glass bottles with teflon liners.

All samples were tagged and documented with station number, analysis required, date and time of sample and initialed by the sampler at the time of sampling. Samples were maintained in the custody of the sample team and delivered to the Region 10 lab by a member of the team on the date of sampling.

Quality Assurance

A field transfer (container opened & resealed in the field) and a field transport (sealed) blank were included as controls, to be analyzed along with the water and sediment samples. Prior to

sampling with the well point, the sampling device was cleaned with acetone, methonal, and distilled water. One gallon of wash water was wasted and a second gallon collected as a QA sample. Between sampling stations the well point and attachments were cleaned using methonal and one gallon of distilled water and then air dried.

The sediment sampler (shovel) was cleaned prior to use and between stations using distilled water, acetone, methanol and finally distilled water and then air dried.

Streamflow Measurement

The streamflow of Mill Creek was measured at four stations (1, 6, 7, & 8) using a Gurley current meter. The stream cross section was divided into segments on 1/2 ft. centers from the left bank to the right and the current meter was placed at 6/10 of the stream depth (measured from the water surface). The velocity of flow in each segment was determined by the revolutions per minute of the meter. The streamflow for each station was then determined by totaling the product of each segment's cross sectional area and velocity for all segments.

Parameter Coverage

Analyses were completed for all priority pollutants as well as additional contaminants identified under the Primary Drinking Water Regulations for each station (both sediment and water samples). Additionally, the water samples were analyzed for pH and conductivity. The EPA regional laboratory used approved EPA laboratory methods and followed associated QC procedures for all determinations.

STORET

STORET numbers assigned each station are as follows:

Station No.	STORET Secondary No.
1	11 H009
2	11 H010
3A	11 H011
3B	11 H012 (well point)
4	11 H013
5	11 H014
6A	11 H015
6B	11 H016 (well point)

Station No.	STORET Secondary No.
7A	11 H017
7B	11 H018 (well point)
8A	11 H019
8B	11 H020 (well point)
9	11 H021
10	11 H022
11	11 H023

RESULTS

On the first day of sampling a light oil sheen was noted on Mill Creek in the morning. The sheen was present at 10:45 am, at the time station 1 was sampled but was no longer observed at the end of the day (3:10 pm when station 8 was sampled). Sampling and analysis for oil was not within the scope of this study however; since a sheen was noted and since oil sheen has also been observed on Mill Creek upstream from Western Processing (H. Aldis - E&E personal communication) on 7/28/82, that fact is stated here for future consideration.

Tables I, II, and III present the analytical results of the survey. Only those chemicals identified as present are reported in the tables. Numbers followed by an "m" indicate the chemical was identified as present but at concentrations less than the limits of quantification. If the chemical was also present in one of the QA blanks at 20% of that in the sample, the sample value was considered as invalid, rejected, and thus is not reported here. Eight contaminants were found in one or more of the blanks at concentrations sufficient to trigger data rejection as follows:

Chromium - 14 rejections
Lead - 5 rejections
Mercury - 13 rejections
Copper - 17 rejections
Nickel - 2 rejections
Phenolics - 7 rejections
Bis (2 ethyhexyl) phthalate - 5 rejections
Di-n-butyl phthalate - 2 rejections.

Blank sample data are given in Table IV.

Surface Water Samples

Samples collected in Mill Creek show a marked increase in priority pollutants (both in quantity and variety) over the reach of stream monitored as shown below:

Number of Station	Compounds	Concentration of Total Quantifiable Pollutants (ug/l)	Stream Flow (cfs)	Quantity of Pollutant (lb/day)
8	6	31	3	0.5
7	12	234		
6	24	2549	3.37	46.3
3	21	2418		
1	23	2468	3.5	46.6

Since there is a wide variation in impact of one priority pollutant compared to another, and there may be synergistic and other effects from various combinations of chemicals, the significance of the above comparison is not clear; however, the data is presented in this manner to demonstrate the magnitude of in-stream pollutant changes in the vicinity of Western Processing.

Station 10, a small pond to the south of Western Processing appears to receive the majority of its inflow from a limited area to the southeast, along the west side of the jogging path. Seepage from Western Processing may also contribute to the pond. Seven compounds were identified with a combined concentration of 38 ug/l.

Stations 11 and 2 are located in a drain running between the jogging path and railroad tracks east of Western Processing. Contaminated flow enters this ditch from the southeast as can be shown from the upstream sample results of 11 compounds present and a combined concentration of 495 ug/l (estimated flow < 0.1 cfs). There is a significant increase in compounds at the downstream sample point (station 2) with 22 chemicals and a 9,668 ug/l combined concentration (est. flow 0.1 cfs). There is no apparent surface input to the ditch between the stations; however, the elevation of the ditch is several feet lower than the Western Processing site elevation and ground water seepage from the direction of Western Processing may be a contributor to the increased contaminants in the ditch.

Sediment Samples

The most contaminated surface water station on Mill Creek (6) also had the largest sediment contamination - 31 compounds with a combined concentration of over 87,000 ug/kg. For comparison, sample results for upstream stations 8 & 7 had respectively 11 and 9 compounds and 1,128 ug/kg and 806 ug/kg concentrations. Downstream stations 3 & 1 registered 14 and 16 compounds and 4,439 ug/kg and 892 ug/kg respectively.

Sediments in the east ditch and intermittent pond represented by Stations 9, 5, & 4 were also highly contaminated with 32 compounds identified at Station 9 (955,600 ug/kg). 23 at Station 5 (225,400 ug/kg) and 19 at Station 4 (75,500 ug/kg). There is no obvious source of flow to this ditch other than from Western Processing property. During high flow periods, the pond would drain to Mill Creek just upstream from Station 3. It is likely that springs noted by DOE Redmond (G. Gregory) on April 2, 1982, upstream from Station 3 are fed from the same pond as it seeps to ground and dries up.

Well Point Samples

Accurate interpretation of the well point sample data is not presently possible due to lack of essential hydrological data. The missing data deal with micro and macro hydrogeology of this site. Mill Creek is a line discharge boundry for regional flow in the unconfined (water table) aquifer. This aquifer may have local (micro scale) variations in flow direction, particularly in the immediate vicinity of a discharge boundry. Such variations in flow result from the presence of zones of higher or lower permeability ("aquatard" or "aquifuge"); and factors such as the extent of sealing along the bottom of Mill Creek. Additional factors controlling the hydrology at this location involve the possible mounding of ground water at the Western Processing site. Such a condition could result in shallow flow in directions other than that of the principal flow (regional flow). Before a detailed, quantitative statement could be made concerning mass loading of contaminants to Mill Creek, a thorough, detailed, hydrogeological investigation would be required.

The information obtained represents the quality of interstitial (that is ground water moving generally towards the surface stream or with the stream) water at points along the creek. Taken at a depth of five feet below the stream bottom, the samples indicate the presence of contaminants; however, the source of these contaminants cannot be determined with present data.

Figures 4, 5, and 6 represent graphically the distribution of total compound concentrations at each sample point in the study area. Each bar chart is divided into base/neutral, acid, volatile and metals fractions to demonstrate the type of compounds most present at each station.

Criteria Exceedance

Several suspected carcinogens are included in the chemicals identified during this study. These include but are not necessarily limited to the following:

trichloroethylene
tetrachloroethylene
tetrachlorophenol
1,1,1 trichloroethane
1,1 dichloroethane
chloroform
1,1 dichloroethylene
1,2 trans-dichloroethylene
methylene chloride

None of the above compounds were found individually at concentrations considered acutely toxic for humans as cited in EPA's Water Quality Criteria Documents (Federal Register Vol. 45. No. 231, Nov. 28, 1980).

The drinking water standard for cadmium (10 ug/l) was exceeded at three surface water stations: 6 (38 ug/l), 3 (29 ug/l), and 1 (34 ug/l). The EP Toxicity limit for cadmium (1,000 ug/l) as well as lead (5000 ug/l) were also exceeded at sediment Station 9 (2650 ug/l & 43,200 ug/l respectively).

In addition to the above, the suggested aquatic life criteria for several chemicals were exceeded as follows:

Parameter	Water Quality Criteria (24 hr. avg.)	Stations with Possible Exceedance
Cadmium	0.012 - 0.051 ug/l (hardness dependent)	8, 7, 6, 3, 1, & 2
Chromium	0.29 ug/l	6, 3, & 1
Lead	0.75-20 ug/l (hardness dependent)	7, 6, 1, 10, & 11
Nickel	59-160 ug/l (hardness dependent)	6, 1, & 2
Zinc	47	7, 6, 3, 1, 11, & 12
Cyanide	3.5	8, 7, 6, 3, 1, 10, & 11

CONCLUSIONS & RECOMMENDATIONS

From the data obtained as a result of the May 20, and 21, 1982, survey it may be concluded that the surface water (Mill Creek) was more contaminated downstream from Western Processing on those dates than it was upstream. In addition to Western Processing one other company, Lidco, a waste hauler located across Mill Creek from Western Processing, may be considered suspect because of the nature of its business. The scope of this study was not broad enough to establish a definite source of the stream contamination between stations 7 and 6. While the general cleanliness of the Lidco site does not suggest current practices contributing to stream pollution, past practices are an unknown.

The chemical contamination of soils in the ditch east of Western Processing is an entirely different matter. The drainage to that ditch has no apparent source other than Western Processing. The highly contaminated sediment found at station 9, including EP toxicity exceedance is likely a direct result of Western Processings activities.

Additional surface water studies may be considered during "wet weather" conditions to add to the data base and better document the movement of contaminants from the immediate vicinity of Western Processing. However the data presently available clearly demonstrates a significant influence in the level of contamination from the study area.

EPA has previously suggested construction of several shallow test wells around the perimiter of Western Processing to define the source, movement & magnitude of contamination. Such a study expanded to include additional sediment analysis could prove valuable in better assessment of the problem and definition of criteria exceedance.

APPENDIX M.

U.S. Environmental Protection Agency Water Quality Data for Mill Creek Survey, January 1984

U.S. Environmental Protection Agency, Region X, Environmental Services Division, Field Operations and Technical Support Branch. Hydrologic Data for Mill Creek Survey. (unpublished) January 1984.

These data were obtained from Region X EPA files and include results from the Mill Creek water quality and sediment survey conducted in January 1984. Metal loadings were calculated for Mill Creek using January 1984 and May 1982 survey results.
